

Intel® 64 and IA-32 Architectures Software Developer's Manual

Volume 2A: Instruction Set Reference, A-L

NOTE: The *Intel® 64 and IA-32 Architectures Software Developer's Manual* consists of ten volumes: *Basic Architecture*, Order Number 253665; *Instruction Set Reference, A-L*, Order Number 253666; *Instruction Set Reference, M-U*, Order Number 253667; *Instruction Set Reference, V*, Order Number 326018; *Instruction Set Reference, W-Z*, Order Number 334569; *System Programming Guide, Part 1*, Order Number 253668; *System Programming Guide, Part 2*, Order Number 253669; *System Programming Guide, Part 3*, Order Number 326019; *System Programming Guide, Part 4*, Order Number 332831; *Model-Specific Registers*, Order Number 335592. Refer to all ten volumes when evaluating your design needs.

Order Number: 253666-088US
June 2025

Notices & Disclaimers

Intel technologies may require enabled hardware, software or service activation.

No product or component can be absolutely secure.

Your costs and results may vary.

You may not use or facilitate the use of this document in connection with any infringement or other legal analysis concerning Intel products described herein. You agree to grant Intel a non-exclusive, royalty-free license to any patent claim thereafter drafted which includes subject matter disclosed herein.

All product plans and roadmaps are subject to change without notice.

The products described may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Intel disclaims all express and implied warranties, including without limitation, the implied warranties of merchantability, fitness for a particular purpose, and non-infringement, as well as any warranty arising from course of performance, course of dealing, or usage in trade.

Code names are used by Intel to identify products, technologies, or services that are in development and not publicly available. These are not "commercial" names and not intended to function as trademarks.

No license (express or implied, by estoppel or otherwise) to any intellectual property rights is granted by this document, with the sole exception that a) you may publish an unmodified copy and b) code included in this document is licensed subject to the Zero-Clause BSD open source license (0BSD), <https://opensource.org/licenses/0BSD>. You may create software implementations based on this document and in compliance with the foregoing that are intended to execute on the Intel product(s) referenced in this document. No rights are granted to create modifications or derivatives of this document.

CHAPTER 1 ABOUT THIS MANUAL

| | | |
|-----|--|-----|
| 1.1 | OVERVIEW OF VOLUME 2A, 2B, 2C, AND 2D: INSTRUCTION SET REFERENCE | 1-1 |
|-----|--|-----|

CHAPTER 2 INSTRUCTION FORMAT

| | | |
|----------|--|------|
| 2.1 | INSTRUCTION FORMAT FOR PROTECTED MODE, REAL-ADDRESS MODE, AND VIRTUAL-8086 MODE | 2-1 |
| 2.1.1 | Instruction Prefixes | 2-1 |
| 2.1.2 | Opcodes | 2-2 |
| 2.1.3 | ModR/M and SIB Bytes | 2-3 |
| 2.1.4 | Displacement and Immediate Bytes | 2-3 |
| 2.1.5 | Addressing-Mode Encoding of ModR/M and SIB Bytes | 2-3 |
| 2.2 | IA-32E MODE | 2-7 |
| 2.2.1 | REX Prefixes | 2-7 |
| 2.2.1.1 | Encoding | 2-8 |
| 2.2.1.2 | More on REX Prefix Fields | 2-8 |
| 2.2.1.3 | Displacement | 2-11 |
| 2.2.1.4 | Direct Memory-Offset MOVs | 2-11 |
| 2.2.1.5 | Immediates | 2-11 |
| 2.2.1.6 | RIP-Relative Addressing | 2-11 |
| 2.2.1.7 | Default 64-Bit Operand Size | 2-12 |
| 2.2.2 | Additional Encodings for Control and Debug Registers | 2-12 |
| 2.3 | INTEL® ADVANCED VECTOR EXTENSIONS (INTEL® AVX) | 2-12 |
| 2.3.1 | Instruction Format | 2-12 |
| 2.3.2 | VEX and the LOCK prefix | 2-13 |
| 2.3.3 | VEX and the 66H, F2H, and F3H prefixes | 2-13 |
| 2.3.4 | VEX and the REX prefix | 2-13 |
| 2.3.5 | The VEX Prefix | 2-13 |
| 2.3.5.1 | VEX Byte 0, bits[7:0] | 2-15 |
| 2.3.5.2 | VEX Byte 1, bit [7] - 'R' | 2-15 |
| 2.3.5.3 | 3-byte VEX byte 1, bit[6] - 'X' | 2-16 |
| 2.3.5.4 | 3-byte VEX byte 1, bit[5] - 'B' | 2-16 |
| 2.3.5.5 | 3-byte VEX byte 2, bit[7] - 'W' | 2-16 |
| 2.3.5.6 | 2-byte VEX Byte 1, bits[6:3] and 3-byte VEX Byte 2, bits [6:3]- 'vvvv' the Source or Dest Register Specifier | 2-16 |
| 2.3.6 | Instruction Operand Encoding and VEX.vvvv, ModR/M | 2-17 |
| 2.3.6.1 | 3-byte VEX byte 1, bits[4:0] - "m-mmmm" | 2-18 |
| 2.3.6.2 | 2-byte VEX byte 1, bit[2], and 3-byte VEX byte 2, bit [2]- "L" | 2-18 |
| 2.3.6.3 | 2-byte VEX byte 1, bits[1:0], and 3-byte VEX byte 2, bits [1:0]- "pp" | 2-19 |
| 2.3.7 | The Opcode Byte | 2-19 |
| 2.3.8 | The ModR/M, SIB, and Displacement Bytes | 2-19 |
| 2.3.9 | The Third Source Operand (Immediate Byte) | 2-19 |
| 2.3.10 | Intel® AVX Instructions and the Upper 128-bits of YMM registers | 2-19 |
| 2.3.10.1 | Vector Length Transition and Programming Considerations | 2-19 |
| 2.3.11 | Intel® AVX Instruction Length | 2-20 |
| 2.3.12 | Vector SIB (VSIB) Memory Addressing | 2-20 |
| 2.3.12.1 | 64-bit Mode VSIB Memory Addressing | 2-21 |
| 2.4 | INTEL® ADVANCED MATRIX EXTENSIONS (INTEL® AMX) | 2-21 |
| 2.5 | INTEL® AVX AND INTEL® SSE INSTRUCTION EXCEPTION CLASSIFICATION | 2-22 |
| 2.5.1 | Exceptions Type 1 (Aligned Memory Reference) | 2-26 |
| 2.5.2 | Exceptions Type 2 (>=16 Byte Memory Reference, Unaligned) | 2-26 |
| 2.5.3 | Exceptions Type 3 (<16 Byte Memory Argument) | 2-27 |
| 2.5.4 | Exceptions Type 4 (>=16 Byte Mem Arg, No Alignment, No Floating-point Exceptions) | 2-28 |
| 2.5.5 | Exceptions Type 5 (<16 Byte Mem Arg and No FP Exceptions) | 2-29 |
| 2.5.6 | Exceptions Type 6 (VEX-Encoded Instructions without Legacy SSE Analogues) | 2-30 |
| 2.5.7 | Exceptions Type 7 (No FP Exceptions, No Memory Arg) | 2-32 |
| 2.5.8 | Exceptions Type 8 (AVX and No Memory Argument) | 2-32 |
| 2.5.9 | Exceptions Type 11 (VEX-only, Mem Arg, No AC, Floating-point Exceptions) | 2-32 |
| 2.5.10 | Exceptions Type 12 (VEX-only, VSIB Mem Arg, No AC, No Floating-point Exceptions) | 2-33 |
| 2.6 | VEX ENCODING SUPPORT FOR GPR INSTRUCTIONS | 2-34 |
| 2.6.1 | Exceptions Type 13 (VEX-Encoded GPR Instructions) | 2-35 |

| | | |
|----------|---|------|
| 2.6.2 | Exceptions Type 14 (CMPCCXADD) | 2-35 |
| 2.7 | INTEL® AVX-512 ENCODING | 2-36 |
| 2.7.1 | Instruction Format and EVEX | 2-36 |
| 2.7.2 | Register Specifier Encoding and EVEX | 2-39 |
| 2.7.3 | Opmask Register Encoding | 2-40 |
| 2.7.4 | Masking Support in EVEX | 2-40 |
| 2.7.5 | Compressed Displacement (disp8*N) Support in EVEX | 2-41 |
| 2.7.6 | EVEX Encoding of Broadcast/Rounding/SAE Support | 2-42 |
| 2.7.7 | Embedded Broadcast Support in EVEX | 2-42 |
| 2.7.8 | Static Rounding Support in EVEX | 2-42 |
| 2.7.9 | SAE Support in EVEX | 2-42 |
| 2.7.10 | Vector Length Orthogonality | 2-42 |
| 2.7.11 | #UD Equations for EVEX | 2-43 |
| 2.7.11.1 | State Dependent #UD | 2-43 |
| 2.7.11.2 | Opcode Independent #UD | 2-43 |
| 2.7.11.3 | Opcode Dependent #UD | 2-44 |
| 2.7.12 | Device Not Available | 2-45 |
| 2.7.13 | Scalar Instructions | 2-45 |
| 2.8 | EXCEPTION CLASSIFICATIONS OF EVEX-ENCODED INSTRUCTIONS | 2-45 |
| 2.8.1 | Exceptions Type E1 and E1NF of EVEX-Encoded Instructions | 2-48 |
| 2.8.2 | Exceptions Type E2 of EVEX-Encoded Instructions | 2-50 |
| 2.8.3 | Exceptions Type E3 and E3NF of EVEX-Encoded Instructions | 2-51 |
| 2.8.4 | Exceptions Type E4 and E4NF of EVEX-Encoded Instructions | 2-53 |
| 2.8.5 | Exceptions Type E5 and E5NF | 2-55 |
| 2.8.6 | Exceptions Type E6 and E6NF | 2-58 |
| 2.8.7 | Exceptions Type E7NM | 2-59 |
| 2.8.8 | Exceptions Type E9 and E9NF | 2-60 |
| 2.8.9 | Exceptions Type E10 and E10NF | 2-62 |
| 2.8.10 | Exceptions Type E11 (EVEX-only, Mem Arg, No AC, Floating-point Exceptions) | 2-64 |
| 2.8.11 | Exceptions Type E12 and E12NP (VSIB Mem Arg, No AC, No Floating-point Exceptions) | 2-66 |
| 2.9 | EXCEPTION CLASSIFICATIONS OF OPMASK INSTRUCTIONS, TYPE K20 AND TYPE K21 | 2-67 |
| 2.9.1 | Exceptions Type K20 | 2-67 |
| 2.9.2 | Exceptions Type K21 | 2-68 |
| 2.10 | INTEL® AMX INSTRUCTION EXCEPTION CLASSES | 2-69 |

CHAPTER 3

INSTRUCTION SET REFERENCE, A-L

| | | |
|----------|--|------|
| 3.1 | INTERPRETING THE INSTRUCTION REFERENCE PAGES | 3-1 |
| 3.1.1 | Instruction Format | 3-1 |
| 3.1.1.1 | Opcode Column in the Instruction Summary Table (Instructions without VEX Prefix) | 3-2 |
| 3.1.1.2 | Opcode Column in the Instruction Summary Table (Instructions with VEX prefix) | 3-3 |
| 3.1.1.3 | Instruction Column in the Opcode Summary Table | 3-5 |
| 3.1.1.4 | Operand Encoding Column in the Instruction Summary Table | 3-8 |
| 3.1.1.5 | 64/32-bit Mode Column in the Instruction Summary Table | 3-8 |
| 3.1.1.6 | CPUID Support Column in the Instruction Summary Table | 3-9 |
| 3.1.1.7 | Description Column in the Instruction Summary Table | 3-9 |
| 3.1.1.8 | Description Section | 3-9 |
| 3.1.1.9 | Operation Section | 3-9 |
| 3.1.1.10 | Intel® C/C++ Compiler Intrinsics Equivalents Section | 3-12 |
| 3.1.1.11 | Flags Affected Section | 3-14 |
| 3.1.1.12 | FPU Flags Affected Section | 3-15 |
| 3.1.1.13 | Protected Mode Exceptions Section | 3-15 |
| 3.1.1.14 | Real-Address Mode Exceptions Section | 3-16 |
| 3.1.1.15 | Virtual-8086 Mode Exceptions Section | 3-16 |
| 3.1.1.16 | Floating-Point Exceptions Section | 3-16 |
| 3.1.1.17 | SIMD Floating-Point Exceptions Section | 3-16 |
| 3.1.1.18 | Compatibility Mode Exceptions Section | 3-17 |
| 3.1.1.19 | 64-Bit Mode Exceptions Section | 3-17 |
| 3.2 | INTEL® AMX CONSIDERATIONS | 3-17 |
| 3.2.1 | Implementation Parameters | 3-17 |
| 3.2.2 | Helper Functions | 3-17 |
| 3.3 | INSTRUCTIONS (A-L) | 3-18 |
| | AAA—ASCII Adjust After Addition | 3-1 |
| | AAD—ASCII Adjust AX Before Division | 3-3 |

| | |
|---|-------|
| AAM—ASCII Adjust AX After Multiply | 3-5 |
| AAS—ASCII Adjust AL After Subtraction | 3-7 |
| ADC—Add With Carry | 3-9 |
| ADCX—Unsigned Integer Addition of Two Operands With Carry Flag | 3-12 |
| ADD—Add | 3-14 |
| ADDPD—Add Packed Double Precision Floating-Point Values | 3-16 |
| ADDPS—Add Packed Single Precision Floating-Point Values | 3-19 |
| ADDSD—Add Scalar Double Precision Floating-Point Values | 3-22 |
| ADDSS—Add Scalar Single Precision Floating-Point Values | 3-24 |
| ADDSUBPD—Packed Double Precision Floating-Point Add/Subtract | 3-26 |
| ADDSUBPS—Packed Single Precision Floating-Point Add/Subtract | 3-28 |
| ADOX — Unsigned Integer Addition of Two Operands With Overflow Flag | 3-31 |
| AESDEC—Perform One Round of an AES Decryption Flow | 3-33 |
| AESDEC128KL—Perform Ten Rounds of AES Decryption Flow With Key Locker Using 128-Bit Key | 3-35 |
| AESDEC256KL—Perform 14 Rounds of AES Decryption Flow With Key Locker Using 256-Bit Key | 3-37 |
| AESDECLAST—Perform Last Round of an AES Decryption Flow | 3-39 |
| AESDECWIDE128KL—Perform Ten Rounds of AES Decryption Flow With Key Locker on 8 Blocks Using 128-Bit Key | 3-41 |
| AESDECWIDE256KL—Perform 14 Rounds of AES Decryption Flow With Key Locker on 8 Blocks Using 256-Bit Key | 3-43 |
| AESENC—Perform One Round of an AES Encryption Flow | 3-45 |
| AESENC128KL—Perform Ten Rounds of AES Encryption Flow With Key Locker Using 128-Bit Key | 3-47 |
| AESENC256KL—Perform 14 Rounds of AES Encryption Flow With Key Locker Using 256-Bit Key | 3-49 |
| AESENCLAST—Perform Last Round of an AES Encryption Flow | 3-51 |
| AESENCWIDE128KL—Perform Ten Rounds of AES Encryption Flow With Key Locker on 8 Blocks Using 128-Bit Key | 3-53 |
| AESENCWIDE256KL—Perform 14 Rounds of AES Encryption Flow With Key Locker on 8 Blocks Using 256-Bit Key | 3-55 |
| AESIMC—Perform the AES InvMixColumn Transformation | 3-57 |
| AESKEYGENASSIST—AES Round Key Generation Assist | 3-58 |
| AND—Logical AND | 3-60 |
| ANDN—Logical AND NOT | 3-62 |
| ANDNPD—Bitwise Logical AND NOT of Packed Double Precision Floating-Point Values | 3-63 |
| ANDNPS—Bitwise Logical AND NOT of Packed Single Precision Floating-Point Values | 3-66 |
| ANDPD—Bitwise Logical AND of Packed Double Precision Floating-Point Values | 3-69 |
| ANDPS—Bitwise Logical AND of Packed Single Precision Floating-Point Values | 3-72 |
| ARPL—Adjust RPL Field of Segment Selector | 3-75 |
| BEXTR—Bit Field Extract | 3-77 |
| BLENDPD—Blend Packed Double Precision Floating-Point Values | 3-78 |
| BLENDPS—Blend Packed Single Precision Floating-Point Values | 3-80 |
| BLENDVPD—Variable Blend Packed Double Precision Floating-Point Values | 3-82 |
| BLENDVPS—Variable Blend Packed Single Precision Floating-Point Values | 3-84 |
| BLSI—Extract Lowest Set Isolated Bit | 3-87 |
| BLSMSK—Get Mask Up to Lowest Set Bit | 3-88 |
| BLSR—Reset Lowest Set Bit | 3-89 |
| BNDCL—Check Lower Bound | 3-90 |
| BNDU/BNDN—Check Upper Bound | 3-92 |
| BNDLDX—Load Extended Bounds Using Address Translation | 3-94 |
| BNDMK—Make Bounds | 3-97 |
| BNDMOV—Move Bounds | 3-99 |
| BNDSTX—Store Extended Bounds Using Address Translation | 3-102 |
| BOUND—Check Array Index Against Bounds | 3-105 |
| BSF—Bit Scan Forward | 3-107 |
| BSR—Bit Scan Reverse | 3-109 |
| BSWAP—Byte Swap | 3-111 |
| BT—Bit Test | 3-112 |
| BTC—Bit Test and Complement | 3-114 |
| BTR—Bit Test and Reset | 3-116 |
| BTS—Bit Test and Set | 3-118 |
| BZHI—Zero High Bits Starting with Specified Bit Position | 3-120 |
| CALL—Call Procedure | 3-121 |
| CBW/CWDE/CDQE—Convert Byte to Word/Convert Word to Doubleword/Convert Doubleword to Quadword | 3-138 |
| CLAC—Clear AC Flag in EFLAGS Register | 3-139 |

| | |
|--|-------|
| CLC—Clear Carry Flag | 3-140 |
| CLD—Clear Direction Flag | 3-141 |
| CLDEMOT—Cache Line Demote | 3-142 |
| CLFLUSH—Flush Cache Line | 3-144 |
| CLFLUSHOPT—Flush Cache Line Optimized | 3-146 |
| CLI—Clear Interrupt Flag | 3-148 |
| CLRSSBSY—Clear Busy Flag in a Supervisor Shadow Stack Token | 3-150 |
| CLTS—Clear Task-Switched Flag in CR0 | 3-152 |
| CLUI—Clear User Interrupt Flag | 3-153 |
| CLWB—Cache Line Write Back | 3-154 |
| CMC—Complement Carry Flag | 3-156 |
| CMOVcc—Conditional Move | 3-157 |
| CMP—Compare Two Operands | 3-161 |
| CMPccXADD—Compare and Add if Condition is Met | 3-163 |
| CMPPD—Compare Packed Double Precision Floating-Point Values | 3-168 |
| CMPPS—Compare Packed Single Precision Floating-Point Values | 3-175 |
| CMPS/CMPSB/CMPSW/CMPSD/CMPSQ—Compare String Operands | 3-181 |
| CMPSD—Compare Scalar Double Precision Floating-Point Value | 3-185 |
| CMPSS—Compare Scalar Single Precision Floating-Point Value | 3-189 |
| CMPXCHG—Compare and Exchange | 3-194 |
| CMPXCHG8B/CMPXCHG16B—Compare and Exchange Bytes | 3-196 |
| COMISD—Compare Scalar Ordered Double Precision Floating-Point Values and Set EFLAGS | 3-199 |
| COMISS—Compare Scalar Ordered Single Precision Floating-Point Values and Set EFLAGS | 3-201 |
| CPUID—CPU Identification | 3-203 |
| CRC32—Accumulate CRC32 Value | 3-251 |
| CVTDQ2PD—Convert Packed Doubleword Integers to Packed Double Precision Floating-Point Values | 3-254 |
| CVTDQ2PS—Convert Packed Doubleword Integers to Packed Single Precision Floating-Point Values | 3-257 |
| CVTPD2DQ—Convert Packed Double Precision Floating-Point Values to Packed Doubleword Integers | 3-260 |
| CVTPD2PI—Convert Packed Double Precision Floating-Point Values to Packed Dword Integers | 3-264 |
| CVTPD2PS—Convert Packed Double Precision Floating-Point Values to Packed Single Precision Floating-Point Values | 3-265 |
| CVTPI2PD—Convert Packed Dword Integers to Packed Double Precision Floating-Point Values | 3-269 |
| CVTPI2PS—Convert Packed Dword Integers to Packed Single Precision Floating-Point Values | 3-270 |
| CVTPS2DQ—Convert Packed Single Precision Floating-Point Values to Packed Signed Doubleword Integer Values | 3-271 |
| CVTPS2PD—Convert Packed Single Precision Floating-Point Values to Packed Double Precision Floating-Point Values | 3-274 |
| CVTPS2PI—Convert Packed Single Precision Floating-Point Values to Packed Dword Integers | 3-277 |
| CVTSD2SI—Convert Scalar Double Precision Floating-Point Value to Signed Integer | 3-278 |
| CVTSD2SS—Convert Scalar Double Precision Floating-Point Value to Scalar Single Precision Floating-Point Value | 3-280 |
| CVTSI2SD—Convert Signed Integer to Scalar Double Precision Floating-Point Value | 3-282 |
| CVTSI2SS—Convert Signed Integer to Scalar Single Precision Floating-Point Value | 3-284 |
| CVTSS2SD—Convert Scalar Single Precision Floating-Point Value to Scalar Double Precision Floating-Point Value | 3-286 |
| CVTSS2SI—Convert Scalar Single Precision Floating-Point Value to Signed Integer | 3-288 |
| CVTTPD2DQ—Convert with Truncation Packed Double Precision Floating-Point Values to Packed Doubleword Integers | 3-290 |
| CVTTPD2PI—Convert With Truncation Packed Double Precision Floating-Point Values to Packed Dword Integers | 3-294 |
| CVTTPS2DQ—Convert With Truncation Packed Single Precision Floating-Point Values to Packed Signed Doubleword Integer Values | 3-295 |
| CVTTPS2PI—Convert With Truncation Packed Single Precision Floating-Point Values to Packed Dword Integers | 3-298 |
| CVTTSD2SI—Convert With Truncation Scalar Double Precision Floating-Point Value to Signed Integer | 3-299 |
| CVTTSS2SI—Convert With Truncation Scalar Single Precision Floating-Point Value to Signed Integer | 3-301 |
| CWD/CDQ/CQO—Convert Word to Doubleword/Convert Doubleword to Quadword | 3-303 |
| DAA—Decimal Adjust AL After Addition | 3-304 |
| DAS—Decimal Adjust AL After Subtraction | 3-306 |
| DEC—Decrement by 1 | 3-308 |
| DIV—Unsigned Divide | 3-310 |
| DIVPD—Divide Packed Double Precision Floating-Point Values | 3-313 |
| DIVPS—Divide Packed Single Precision Floating-Point Values | 3-316 |
| DIVSD—Divide Scalar Double Precision Floating-Point Value | 3-319 |

| | |
|---|-------|
| DIVSS—Divide Scalar Single Precision Floating-Point Values | 3-321 |
| DPPD—Dot Product of Packed Double Precision Floating-Point Values | 3-323 |
| DPPS—Dot Product of Packed Single Precision Floating-Point Values | 3-325 |
| EMMS—Empty MMX Technology State | 3-328 |
| ENCODEKEY128—Encode 128-Bit Key With Key Locker | 3-329 |
| ENCODEKEY256—Encode 256-Bit Key With Key Locker | 3-331 |
| ENDBR32—Terminate an Indirect Branch in 32-bit and Compatibility Mode | 3-333 |
| ENDBR64—Terminate an Indirect Branch in 64-bit Mode | 3-334 |
| ENQCMD—Enqueue Command | 3-335 |
| ENQCMLS—Enqueue Command Supervisor | 3-338 |
| ENTER—Make Stack Frame for Procedure Parameters | 3-341 |
| EXTRACTPS—Extract Packed Floating-Point Values | 3-344 |
| F2XM1—Compute 2x-1 | 3-346 |
| FABS—Absolute Value | 3-348 |
| FADD/FADDP/FIADD—Add | 3-350 |
| FBLD—Load Binary Coded Decimal | 3-353 |
| FBSTP—Store BCD Integer and Pop | 3-355 |
| FCHS—Change Sign | 3-357 |
| FCLEX/FNCLEX—Clear Exceptions | 3-359 |
| FCMOVcc—Floating-Point Conditional Move | 3-361 |
| FCOM/FCOMP/FCOMPP—Compare Floating-Point Values | 3-363 |
| FCOMI/FCOMIP/ FUCOMI/FUCOMIP—Compare Floating-Point Values and Set EFLAGS | 3-366 |
| FCOS—Cosine | 3-369 |
| FDECSTP—Decrement Stack-Top Pointer | 3-371 |
| FDIV/FDIVP/FIDIV—Divide | 3-372 |
| FDIVR/FDIVRP/FIDIVR—Reverse Divide | 3-375 |
| FFREE—Free Floating-Point Register | 3-378 |
| FICOM/FICOMP—Compare Integer | 3-379 |
| FILD—Load Integer | 3-381 |
| FINCSTP—Increment Stack-Top Pointer | 3-383 |
| FINIT/FNINIT—Initialize Floating-Point Unit | 3-384 |
| FIST/FISTP—Store Integer | 3-386 |
| FISTTP—Store Integer With Truncation | 3-389 |
| FLD—Load Floating-Point Value | 3-391 |
| FLD1/FLDL2T/FLDL2E/FLDPI/FLDLG2/FLDLN2/FLDZ—Load Constant | 3-393 |
| FLDCW—Load x87 FPU Control Word | 3-395 |
| FLDENV—Load x87 FPU Environment | 3-397 |
| FMUL/FMULP/FIMUL—Multiply | 3-399 |
| FNOP—No Operation | 3-402 |
| FPATAN—Partial Arctangent | 3-403 |
| FPREM—Partial Remainder | 3-405 |
| FPREM1—Partial Remainder | 3-407 |
| FPTAN—Partial Tangent | 3-409 |
| FRNDINT—Round to Integer | 3-411 |
| FRSTOR—Restore x87 FPU State | 3-412 |
| FSAVE/FNSAVE—Store x87 FPU State | 3-414 |
| FSCALE—Scale | 3-417 |
| FSIN—Sine | 3-419 |
| FSINCOS—Sine and Cosine | 3-421 |
| FSQRT—Square Root | 3-423 |
| FST/FSTP—Store Floating-Point Value | 3-425 |
| FSTCW/FNSTCW—Store x87 FPU Control Word | 3-427 |
| FSTENV/FNSTENV—Store x87 FPU Environment | 3-429 |
| FSTSW/FNSTSW—Store x87 FPU Status Word | 3-431 |
| FSUB/FSUBP/FISUB—Subtract | 3-433 |
| FSUBR/FSUBRP/FISUBR—Reverse Subtract | 3-436 |
| FTST—TEST | 3-439 |
| FUCOM/FUCOMP/FUCOMPP—Unordered Compare Floating-Point Values | 3-441 |
| FXAM—Examine Floating-Point | 3-444 |

| | |
|---|-------|
| FXCH—Exchange Register Contents | 3-446 |
| FXRSTOR—Restore x87 FPU, MMX, XMM, and MXCSR State | 3-448 |
| FXSAVE—Save x87 FPU, MMX Technology, and SSE State | 3-451 |
| FXTRACT—Extract Exponent and Significand | 3-459 |
| FYL2X—Compute $y * \log_2 x$ | 3-461 |
| FYL2XP1—Compute $y * \log_2(x + 1)$ | 3-463 |
| GF2P8AFFINEINVQB—Galois Field Affine Transformation Inverse | 3-465 |
| GF2P8AFFINEQB—Galois Field Affine Transformation | 3-468 |
| GF2P8MULB—Galois Field Multiply Bytes | 3-470 |
| HADDDP—Packed Double Precision Floating-Point Horizontal Add | 3-472 |
| HADDPS—Packed Single Precision Floating-Point Horizontal Add | 3-475 |
| HLT—Halt | 3-478 |
| HRESET—History Reset | 3-479 |
| HSUBPD—Packed Double Precision Floating-Point Horizontal Subtract | 3-481 |
| HSUBPS—Packed Single Precision Floating-Point Horizontal Subtract | 3-484 |
| IDIV—Signed Divide | 3-487 |
| IMUL—Signed Multiply | 3-490 |
| IN—Input From Port | 3-494 |
| INC—Increment by 1 | 3-496 |
| INCSPD/INCSPQ—Increment Shadow Stack Pointer | 3-498 |
| INSERTPS—Insert Scalar Single Precision Floating-Point Value | 3-500 |
| INS/INSB/INSW/INSD—Input from Port to String | 3-503 |
| INT n/INT0/INT3/INT1—Call to Interrupt Procedure | 3-506 |
| INVD—Invalidate Internal Caches | 3-521 |
| INVLPB—Invalidate TLB Entries | 3-523 |
| INVPID—Invalidate Process-Context Identifier | 3-525 |
| IRET/IRETD/IRETQ—Interrupt Return | 3-528 |
| Jcc—Jump if Condition Is Met | 3-537 |
| JMP—Jump | 3-542 |
| KADDW/KADDB/KADDQ/KADDD—ADD Two Masks | 3-551 |
| KANDNW/KANDNB/KANDNQ/KANDND—Bitwise Logical AND NOT Masks | 3-553 |
| KANDW/KANDB/KANDQ/KANDD—Bitwise Logical AND Masks | 3-554 |
| KMOVW/KMOVB/KMOVQ/KMOVD—Move From and to Mask Registers | 3-555 |
| KNOTW/KNOTB/KNOTQ/KNOTD—NOT Mask Register | 3-557 |
| KORTESTW/KORTESTB/KORTESTQ/KORTESTD—OR Masks and Set Flags | 3-558 |
| KORW/KORB/KORQ/KORD—Bitwise Logical OR Masks | 3-560 |
| KSHIFTLW/KSHIFTLB/KSHIFTLQ/KSHIFTLT—Shift Left Mask Registers | 3-561 |
| KSHIFTRW/KSHIFTRB/KSHIFTRQ/KSHIFTRD—Shift Right Mask Registers | 3-563 |
| KTESTW/KTESTB/KTESTQ/KTESTD—Packed Bit Test Masks and Set Flags | 3-565 |
| KUNPCKBW/KUNPCKWD/KUNPCKDQ—Unpack for Mask Registers | 3-567 |
| KXNORW/KXNORB/KXNORQ/KXNORD—Bitwise Logical XNOR Masks | 3-568 |
| KXORW/KXORB/KXORQ/KXORD—Bitwise Logical XOR Masks | 3-569 |
| LAHF—Load Status Flags Into AH Register | 3-570 |
| LAR—Load Access Rights | 3-571 |
| LDDQU—Load Unaligned Integer 128 Bits | 3-575 |
| LDMXCSR—Load MXCSR Register | 3-577 |
| LDS/LES/LFS/LGS/LSS—Load Far Pointer | 3-578 |
| LDTILECFG—Load Tile Configuration | 3-582 |
| LEA—Load Effective Address | 3-585 |
| LEAVE—High Level Procedure Exit | 3-588 |
| LFENCE—Load Fence | 3-590 |
| LGDT/LIDT—Load Global/Interrupt Descriptor Table Register | 3-591 |
| LLDT—Load Local Descriptor Table Register | 3-594 |
| LMSW—Load Machine Status Word | 3-596 |
| LOADIWKEY—Load Internal Wrapping Key With Key Locker | 3-598 |
| LOCK—Assert LOCK# Signal Prefix | 3-601 |
| LODS/LODSB/LODSW/LODSD/LODSQ—Load String | 3-603 |
| LOOP/LOOPCC—Loop According to ECX Counter | 3-606 |
| LSL—Load Segment Limit | 3-609 |

| | |
|---|-------|
| LTR—Load Task Register | 3-612 |
| LZCNT—Count the Number of Leading Zero Bits | 3-614 |

CHAPTER 4**INSTRUCTION SET REFERENCE, M-U**

| | | |
|-------|---|-------|
| 4.1 | IMM8 CONTROL BYTE OPERATION FOR PCMPSTRI / PCMPSTRM / PCMPISTRI / PCMPISTRM | 4-1 |
| 4.1.1 | General Description | 4-1 |
| 4.1.2 | Source Data Format | 4-1 |
| 4.1.3 | Aggregation Operation | 4-2 |
| 4.1.4 | Polarity | 4-2 |
| 4.1.5 | Output Selection | 4-3 |
| 4.1.6 | Valid/Invalid Override of Comparisons | 4-3 |
| 4.1.7 | Summary of Im8 Control byte | 4-4 |
| 4.1.8 | Diagram Comparison and Aggregation Process | 4-5 |
| 4.2 | COMMON TRANSFORMATION AND PRIMITIVE FUNCTIONS FOR SHA1XXX AND SHA256XXX | 4-5 |
| 4.3 | INSTRUCTIONS (M-U) | 4-6 |
| | MASKMOVDQU—Store Selected Bytes of Double Quadword | 4-1 |
| | MASKMOVQ—Store Selected Bytes of Quadword | 4-3 |
| | MAXPD—Maximum of Packed Double Precision Floating-Point Values | 4-5 |
| | MAXPS—Maximum of Packed Single Precision Floating-Point Values | 4-8 |
| | MAXSD—Return Maximum Scalar Double Precision Floating-Point Value | 4-11 |
| | MAXSS—Return Maximum Scalar Single Precision Floating-Point Value | 4-13 |
| | MFENCE—Memory Fence | 4-15 |
| | MINPD—Minimum of Packed Double Precision Floating-Point Values | 4-16 |
| | MINPS—Minimum of Packed Single Precision Floating-Point Values | 4-19 |
| | MINSD—Return Minimum Scalar Double Precision Floating-Point Value | 4-22 |
| | MINSS—Return Minimum Scalar Single Precision Floating-Point Value | 4-24 |
| | MONITOR—Set Up Monitor Address | 4-26 |
| | MOV—Move | 4-28 |
| | MOV—Move to/from Control Registers | 4-32 |
| | MOV—Move to/from Debug Registers | 4-35 |
| | MOVAPD—Move Aligned Packed Double Precision Floating-Point Values | 4-37 |
| | MOVAPS—Move Aligned Packed Single Precision Floating-Point Values | 4-41 |
| | MOVBE—Move Data After Swapping Bytes | 4-45 |
| | MOVDDUP—Replicate Double Precision Floating-Point Values | 4-48 |
| | MOVDIR64B—Move 64 Bytes as Direct Store | 4-51 |
| | MOVDIRI—Move Doubleword as Direct Store | 4-53 |
| | MOVD/MOVQ—Move Doubleword/Move Quadword | 4-55 |
| | MOVQ2Q—Move Quadword from XMM to MMX Technology Register | 4-59 |
| | MOVQQA, VMOVQQA32/64—Move Aligned Packed Integer Values | 4-60 |
| | MOVQQU, VMOVQQU8/16/32/64—Move Unaligned Packed Integer Values | 4-65 |
| | MOVHLPS—Move Packed Single Precision Floating-Point Values High to Low | 4-73 |
| | MOVHPD—Move High Packed Double Precision Floating-Point Value | 4-75 |
| | MOVHPS—Move High Packed Single Precision Floating-Point Values | 4-77 |
| | MOVLHPS—Move Packed Single Precision Floating-Point Values Low to High | 4-79 |
| | MOVLPD—Move Low Packed Double Precision Floating-Point Value | 4-81 |
| | MOVLPS—Move Low Packed Single Precision Floating-Point Values | 4-83 |
| | MOVMSKPD—Extract Packed Double Precision Floating-Point Sign Mask | 4-85 |
| | MOVMSKPS—Extract Packed Single Precision Floating-Point Sign Mask | 4-87 |
| | MOVNTDQ—Store Packed Integers Using Non-Temporal Hint | 4-89 |
| | MOVNTDQA—Load Double Quadword Non-Temporal Aligned Hint | 4-91 |
| | MOVNTI—Store Doubleword Using Non-Temporal Hint | 4-93 |
| | MOVNTPD—Store Packed Double Precision Floating-Point Values Using Non-Temporal Hint | 4-95 |
| | MOVNTPS—Store Packed Single Precision Floating-Point Values Using Non-Temporal Hint | 4-97 |
| | MOVNTQ—Store of Quadword Using Non-Temporal Hint | 4-99 |
| | MOVQ—Move Quadword | 4-100 |
| | MOVQ2DQ—Move Quadword from MMX Technology to XMM Register | 4-103 |
| | MOVSI/MOVSBI/MOVSW/MOVSQ—Move Data From String to String | 4-105 |
| | MOVSD—Move or Merge Scalar Double Precision Floating-Point Value | 4-109 |
| | MOVSHDUP—Replicate Single Precision Floating-Point Values | 4-112 |

| | |
|--|-------|
| MOVSLDUP—Replicate Single Precision Floating-Point Values | 4-115 |
| MOVSS—Move or Merge Scalar Single Precision Floating-Point Value | 4-118 |
| MOVSX/MOVXSD—Move With Sign-Extension | 4-121 |
| MOVUPD—Move Unaligned Packed Double Precision Floating-Point Values | 4-123 |
| MOVUPS—Move Unaligned Packed Single Precision Floating-Point Values | 4-127 |
| MOVZX—Move With Zero-Extend | 4-131 |
| MPSADBW—Compute Multiple Packed Sums of Absolute Difference | 4-133 |
| MUL—Unsigned Multiply | 4-141 |
| MULPD—Multiply Packed Double Precision Floating-Point Values | 4-143 |
| MULPS—Multiply Packed Single Precision Floating-Point Values | 4-146 |
| MULSD—Multiply Scalar Double Precision Floating-Point Value | 4-149 |
| MULSS—Multiply Scalar Single Precision Floating-Point Values | 4-151 |
| MULX—Unsigned Multiply Without Affecting Flags | 4-153 |
| MWAIT—Monitor Wait | 4-155 |
| NEG—Two’s Complement Negation | 4-158 |
| NOP—No Operation | 4-160 |
| NOT—One’s Complement Negation | 4-161 |
| OR—Logical Inclusive OR | 4-163 |
| ORPD—Bitwise Logical OR of Packed Double Precision Floating-Point Values | 4-165 |
| ORPS—Bitwise Logical OR of Packed Single Precision Floating-Point Values | 4-168 |
| OUT—Output to Port | 4-171 |
| OUTS/OUTSB/OUTSW/OUTSD—Output String to Port | 4-173 |
| PABSB/PABSW/PABSD/PABSQ—Packed Absolute Value | 4-177 |
| PACKSSWB/PACKSSDW—Pack With Signed Saturation | 4-183 |
| PACKUSDW—Pack With Unsigned Saturation | 4-191 |
| PACKUSWB—Pack With Unsigned Saturation | 4-196 |
| PADDB/PADDW/PADDD/PADDQ—Add Packed Integers | 4-201 |
| PADDSB/PADDSW—Add Packed Signed Integers with Signed Saturation | 4-208 |
| PADDUSB/PADDUSW—Add Packed Unsigned Integers With Unsigned Saturation | 4-212 |
| PALIGNR—Packed Align Right | 4-216 |
| PAND—Logical AND | 4-220 |
| PANDN—Logical AND NOT | 4-223 |
| PAUSE—Spin Loop Hint | 4-226 |
| PAVGB/PAVGW—Average Packed Integers | 4-227 |
| PBLENDVB—Variable Blend Packed Bytes | 4-231 |
| PBLENDW—Blend Packed Words | 4-235 |
| PCLMULQDQ—Carry-Less Multiplication Quadword | 4-238 |
| PCMPEQB/PCMPEQW/PCMPEQD—Compare Packed Data for Equal | 4-241 |
| PCMPEQQ—Compare Packed Qword Data for Equal | 4-247 |
| PCMPSTR—Packed Compare Explicit Length Strings, Return Index | 4-250 |
| PCMPSTRM—Packed Compare Explicit Length Strings, Return Mask | 4-252 |
| PCMPGTB/PCMPGTW/PCMPGTD—Compare Packed Signed Integers for Greater Than | 4-254 |
| PCMPGTQ—Compare Packed Data for Greater Than | 4-260 |
| PCMPISTR—Packed Compare Implicit Length Strings, Return Index | 4-263 |
| PCMPISTRM—Packed Compare Implicit Length Strings, Return Mask | 4-265 |
| PCONFIG—Platform Configuration | 4-267 |
| PDEP—Parallel Bits Deposit | 4-273 |
| PEXT—Parallel Bits Extract | 4-275 |
| PEXTRB/PEXTRD/PEXTRQ—Extract Byte/Dword/Qword | 4-277 |
| PEXTRW—Extract Word | 4-280 |
| PHADDSW—Packed Horizontal Add and Saturate | 4-283 |
| PHADDW/PHADD—Packed Horizontal Add | 4-285 |
| PHMINPOSUW—Packed Horizontal Word Minimum | 4-289 |
| PHSUBSW—Packed Horizontal Subtract and Saturate | 4-291 |
| PHSUBW/PHSUBD—Packed Horizontal Subtract | 4-293 |
| PINSRB/PINSRD/PINSRQ—Insert Byte/Dword/Qword | 4-296 |
| PINSRW—Insert Word | 4-299 |
| PMADDUSW—Multiply and Add Packed Signed and Unsigned Bytes | 4-301 |
| PMADDWD—Multiply and Add Packed Integers | 4-304 |

| | |
|--|-------|
| PMAXSB/PMAXSW/PMAXSD/PMAXSQ—Maximum of Packed Signed Integers | 4-307 |
| PMAXUB/PMAXUW—Maximum of Packed Unsigned Integers | 4-314 |
| PMAXUD/PMAXUQ—Maximum of Packed Unsigned Integers | 4-319 |
| PMINSB/PMINSW—Minimum of Packed Signed Integers | 4-323 |
| PMINSUD/PMINSQ—Minimum of Packed Signed Integers | 4-328 |
| PMINUB/PMINUW—Minimum of Packed Unsigned Integers | 4-332 |
| PMINUD/PMINUQ—Minimum of Packed Unsigned Integers | 4-337 |
| PMOVMASKB—Move Byte Mask | 4-341 |
| PMOVXSX—Packed Move With Sign Extend | 4-343 |
| PMOVZX—Packed Move With Zero Extend | 4-353 |
| PMULDQ—Multiply Packed Doubleword Integers | 4-363 |
| PMULHRSW—Packed Multiply High With Round and Scale | 4-366 |
| PMULHUW—Multiply Packed Unsigned Integers and Store High Result | 4-370 |
| PMULHW—Multiply Packed Signed Integers and Store High Result | 4-374 |
| PMULLD/PMULLQ—Multiply Packed Integers and Store Low Result | 4-378 |
| PMULLW—Multiply Packed Signed Integers and Store Low Result | 4-382 |
| PMULUDQ—Multiply Packed Unsigned Doubleword Integers | 4-386 |
| POP—Pop a Value From the Stack | 4-389 |
| POPA/POPAD—Pop All General-Purpose Registers | 4-394 |
| POPCNT—Return the Count of Number of Bits Set to 1 | 4-396 |
| POPF/POPFD/POPFDQ—Pop Stack Into EFLAGS Register | 4-398 |
| POR—Bitwise Logical OR | 4-402 |
| PREFETCHH—Prefetch Data Into Caches | 4-405 |
| PREFETCHW—Prefetch Data Into Caches in Anticipation of a Write | 4-407 |
| PSADB—Compute Sum of Absolute Differences | 4-409 |
| PSHUFB—Packed Shuffle Bytes | 4-413 |
| PSHUFD—Shuffle Packed Doublewords | 4-417 |
| PSHUFHW—Shuffle Packed High Words | 4-421 |
| PSHUFLW—Shuffle Packed Low Words | 4-424 |
| PSHUFW—Shuffle Packed Words | 4-427 |
| PSIGNB/PSIGNW/PSIGND—Packed SIGN | 4-428 |
| PSLLDQ—Shift Double Quadword Left Logical | 4-432 |
| PSLLW/PSLLD/PSLLQ—Shift Packed Data Left Logical | 4-434 |
| PSRAW/PSRAD/PSRAQ—Shift Packed Data Right Arithmetic | 4-446 |
| PSRLDQ—Shift Double Quadword Right Logical | 4-456 |
| PSRLW/PSRLD/PSRLQ—Shift Packed Data Right Logical | 4-458 |
| PSUBB/PSUBW/PSUBD—Subtract Packed Integers | 4-470 |
| PSUBQ—Subtract Packed Quadword Integers | 4-478 |
| PSUBSB/PSUBSW—Subtract Packed Signed Integers With Signed Saturation | 4-481 |
| PSUBUSB/PSUBUSW—Subtract Packed Unsigned Integers With Unsigned Saturation | 4-485 |
| PTEST—Logical Compare | 4-489 |
| PTWRITE—Write Data to a Processor Trace Packet | 4-491 |
| PUNPCKHBW/PUNPCKHWD/PUNPCKHDQ/PUNPCKHQDQ—Unpack High Data | 4-493 |
| PUNPCKLBW/PUNPCKLWD/PUNPCKLDQ/PUNPCKLQDQ—Unpack Low Data | 4-503 |
| PUSH—Push Word, Doubleword, or Quadword Onto the Stack | 4-513 |
| PUSHA/PUSHAD—Push All General-Purpose Registers | 4-517 |
| PUSHF/PUSHFD/PUSHFQ—Push EFLAGS Register Onto the Stack | 4-519 |
| PXOR—Logical Exclusive OR | 4-521 |
| RCL/RCR/ROL/ROR—Rotate | 4-524 |
| RCPPS—Compute Reciprocals of Packed Single Precision Floating-Point Values | 4-529 |
| RCPSS—Compute Reciprocal of Scalar Single Precision Floating-Point Values | 4-531 |
| RDFSBASE/RDGSBASE—Read FS/GS Segment Base | 4-533 |
| RDMSR—Read From Model Specific Register | 4-535 |
| RDMSRLIST—Read List of Model Specific Registers | 4-537 |
| RDPID—Read Processor ID | 4-539 |
| RDPKRU—Read Protection Key Rights for User Pages | 4-540 |
| RDPMC—Read Performance-Monitoring Counters | 4-542 |
| RDRAND—Read Random Number | 4-545 |
| RDSEED—Read Random SEED | 4-547 |

| | |
|--|-------|
| RDSSPD/RDSSPQ—Read Shadow Stack Pointer | 4-549 |
| RDTSC—Read Time-Stamp Counter | 4-550 |
| RDTSCP—Read Time-Stamp Counter and Processor ID | 4-552 |
| REP—Repeat String Operation (Prefix) | 4-554 |
| REPE/REPZ—Repeat String Operation While Zero (Prefix) | 4-556 |
| REPNE/REPNZ—Repeat String Operation While Not Zero (Prefix) | 4-558 |
| RET—Return From Procedure | 4-560 |
| RORX — Rotate Right Logical Without Affecting Flags | 4-573 |
| ROUNDPD—Round Packed Double Precision Floating-Point Values | 4-574 |
| ROUNDPS—Round Packed Single Precision Floating-Point Values | 4-577 |
| ROUNDSD—Round Scalar Double Precision Floating-Point Values | 4-579 |
| ROUNDSS—Round Scalar Single Precision Floating-Point Values | 4-581 |
| RSM—Resume From System Management Mode | 4-583 |
| RSQRTPS—Compute Reciprocals of Square Roots of Packed Single Precision Floating-Point Values | 4-585 |
| RSQRTSS—Compute Reciprocal of Square Root of Scalar Single Precision Floating-Point Value | 4-587 |
| RSTORSSP—Restore Saved Shadow Stack Pointer | 4-589 |
| SAHF—Store AH Into Flags | 4-592 |
| SAL/SAR/SHL/SHR—Shift | 4-594 |
| SARX/SHLX/SHRX—Shift Without Affecting Flags | 4-599 |
| SAVEPREVSSP—Save Previous Shadow Stack Pointer | 4-601 |
| SBB—Integer Subtraction With Borrow | 4-603 |
| SCAS/SCASB/SCASW/SCASD—Scan String | 4-606 |
| SENDUIPI—Send User Interprocessor Interrupt | 4-610 |
| SERIALIZE—Serialize Instruction Execution | 4-612 |
| SETcc—Set Byte on Condition | 4-613 |
| SETSSBSY—Mark Shadow Stack Busy | 4-616 |
| SFENCE—Store Fence | 4-618 |
| SGDT—Store Global Descriptor Table Register | 4-619 |
| SHA1MSG1—Perform an Intermediate Calculation for the Next Four SHA1 Message Dwords | 4-621 |
| SHA1MSG2—Perform a Final Calculation for the Next Four SHA1 Message Dwords | 4-622 |
| SHA1NEXTE—Calculate SHA1 State Variable E After Four Rounds | 4-623 |
| SHA1RND4—Perform Four Rounds of SHA1 Operation | 4-624 |
| SHA256MSG1—Perform an Intermediate Calculation for the Next Four SHA256 Message Dwords | 4-626 |
| SHA256MSG2—Perform a Final Calculation for the Next Four SHA256 Message Dwords | 4-627 |
| SHA256RND2—Perform Two Rounds of SHA256 Operation | 4-628 |
| SHLD—Double Precision Shift Left | 4-630 |
| SHRD—Double Precision Shift Right | 4-633 |
| SHUFPD—Packed Interleave Shuffle of Pairs of Double Precision Floating-Point Values | 4-636 |
| SHUFPS—Packed Interleave Shuffle of Quadruplets of Single Precision Floating-Point Values | 4-641 |
| SIDT—Store Interrupt Descriptor Table Register | 4-645 |
| SLDT—Store Local Descriptor Table Register | 4-647 |
| SMSW—Store Machine Status Word | 4-649 |
| SQRTPD—Square Root of Double Precision Floating-Point Values | 4-651 |
| SQRTPS—Square Root of Single Precision Floating-Point Values | 4-654 |
| SQRTSD—Compute Square Root of Scalar Double Precision Floating-Point Value | 4-657 |
| SQRTSS—Compute Square Root of Scalar Single Precision Value | 4-659 |
| STAC—Set AC Flag in EFLAGS Register | 4-661 |
| STC—Set Carry Flag | 4-662 |
| STD—Set Direction Flag | 4-663 |
| STI—Set Interrupt Flag | 4-664 |
| STMXCSR—Store MXCSR Register State | 4-666 |
| STOS/STOSB/STOSW/STOSD/STOSQ—Store String | 4-667 |
| STR—Store Task Register | 4-670 |
| STTILECFG—Store Tile Configuration | 4-672 |
| STUI—Set User Interrupt Flag | 4-674 |
| SUB—Subtract | 4-675 |
| SUBPD—Subtract Packed Double Precision Floating-Point Values | 4-677 |
| SUBPS—Subtract Packed Single Precision Floating-Point Values | 4-680 |
| SUBSD—Subtract Scalar Double Precision Floating-Point Value | 4-683 |

| | |
|--|-------|
| SUBSS—Subtract Scalar Single Precision Floating-Point Value | 4-685 |
| SWAPGS—Swap GS Base Register | 4-687 |
| SYSCALL—Fast System Call | 4-689 |
| SYSENTER—Fast System Call | 4-692 |
| SYSEXIT—Fast Return from Fast System Call | 4-695 |
| SYSRET—Return From Fast System Call | 4-698 |
| TDPBF16PS—Dot Product of BF16 Tiles Accumulated into Packed Single Precision Tile | 4-701 |
| TDPBSSD/TDPBSUD/TDPBUSD/TDPBUUD—Dot Product of Signed/Unsigned Bytes with Dword Accumulation | 4-703 |
| TDPFP16PS—Dot Product of FP16 Tiles Accumulated into Packed Single Precision Tile | 4-705 |
| TEST—Logical Compare | 4-707 |
| TESTUI—Determine User Interrupt Flag | 4-709 |
| TILELOAD/TILELOADDT1—Load Tile | 4-710 |
| TILERELASE—Release Tile | 4-712 |
| TILESTORED—Store Tile | 4-713 |
| TILEZERO—Zero Tile | 4-714 |
| TPAUSE—Timed PAUSE | 4-715 |
| TZCNT—Count the Number of Trailing Zero Bits | 4-717 |
| UCOMISD—Unordered Compare Scalar Double Precision Floating-Point Values and Set EFLAGS | 4-719 |
| UCOMISS—Unordered Compare Scalar Single Precision Floating-Point Values and Set EFLAGS | 4-721 |
| UD—Undefined Instruction | 4-723 |
| UIRET—User-Interrupt Return | 4-724 |
| UMONITOR—User Level Set Up Monitor Address | 4-726 |
| UMWAIT—User Level Monitor Wait | 4-728 |
| UNPCKHPD—Unpack and Interleave High Packed Double Precision Floating-Point Values | 4-730 |
| UNPCKHPS—Unpack and Interleave High Packed Single Precision Floating-Point Values | 4-734 |
| UNPCKLPD—Unpack and Interleave Low Packed Double Precision Floating-Point Values | 4-738 |
| UNPCKLPS—Unpack and Interleave Low Packed Single Precision Floating-Point Values | 4-742 |

CHAPTER 5

INSTRUCTION SET REFERENCE, V

| | | |
|-----|---|------|
| 5.1 | TERNARY BIT VECTOR LOGIC TABLE | 5-1 |
| 5.2 | INSTRUCTIONS (V) | 5-3 |
| | VADDPH—Add Packed FP16 Values | 5-1 |
| | VADDSDH—Add Scalar FP16 Values | 5-3 |
| | VALIGND/VALIGNQ—Align Doubleword/Quadword Vectors | 5-4 |
| | VBCSTNEBF162PS—Load BF16 Element and Convert to FP32 Element With Broadcast | 5-7 |
| | VBCSTNESH2PS—Load FP16 Element and Convert to FP32 Element with Broadcast | 5-8 |
| | VBLENDMPD/VBLENDMPS—Blend Float64/Float32 Vectors Using an OpMask Control | 5-9 |
| | VBROADCAST—Load with Broadcast Floating-Point Data | 5-12 |
| | VCMPPPH—Compare Packed FP16 Values | 5-20 |
| | VCMPPSH—Compare Scalar FP16 Values | 5-22 |
| | VCOMISH—Compare Scalar Ordered FP16 Values and Set EFLAGS | 5-24 |
| | VCOMPRESSPD—Store Sparse Packed Double Precision Floating-Point Values Into Dense Memory | 5-26 |
| | VCOMPRESSPS—Store Sparse Packed Single Precision Floating-Point Values Into Dense Memory | 5-28 |
| | VCVTDQ2PH—Convert Packed Signed Doubleword Integers to Packed FP16 Values | 5-30 |
| | VCVTNE2PS2BF16—Convert Two Packed Single Data to One Packed BF16 Data | 5-32 |
| | VCVTNEEBF162PS—Convert Even Elements of Packed BF16 Values to FP32 Values | 5-34 |
| | VCVTNEEPH2PS—Convert Even Elements of Packed FP16 Values to FP32 Values | 5-35 |
| | VCVTNEOBF162PS—Convert Odd Elements of Packed BF16 Values to FP32 Values | 5-36 |
| | VCVTNEOPH2PS—Convert Odd Elements of Packed FP16 Values to FP32 Values | 5-37 |
| | VCVTNEPS2BF16—Convert Packed Single Data to Packed BF16 Data | 5-38 |
| | VCVTPD2PH—Convert Packed Double Precision FP Values to Packed FP16 Values | 5-40 |
| | VCVTPD2QQ—Convert Packed Double Precision Floating-Point Values to Packed Quadword Integers | 5-42 |
| | VCVTPD2UDQ—Convert Packed Double Precision Floating-Point Values to Packed Unsigned Doubleword Integers | 5-44 |
| | VCVTPD2UQQ—Convert Packed Double Precision Floating-Point Values to Packed Unsigned Quadword Integers | 5-47 |
| | VCVTPH2DQ—Convert Packed FP16 Values to Signed Doubleword Integers | 5-50 |
| | VCVTPH2PD—Convert Packed FP16 Values to FP64 Values | 5-52 |
| | VCVTPH2PS/VCVTPH2PSX—Convert Packed FP16 Values to Single Precision Floating-Point Values | 5-54 |
| | VCVTPH2QQ—Convert Packed FP16 Values to Signed Quadword Integer Values | 5-58 |

| | |
|--|-------|
| VCVTPH2UDQ—Convert Packed FP16 Values to Unsigned Doubleword Integers | 5-60 |
| VCVTPH2UQQ—Convert Packed FP16 Values to Unsigned Quadword Integers | 5-62 |
| VCVTPH2UW—Convert Packed FP16 Values to Unsigned Word Integers | 5-64 |
| VCVTPH2W—Convert Packed FP16 Values to Signed Word Integers | 5-66 |
| VCVTPS2PH—Convert Single Precision FP Value to 16-bit FP Value | 5-68 |
| VCVTPS2PHX—Convert Packed Single Precision Floating-Point Values to Packed FP16 Values | 5-72 |
| VCVTPS2QQ—Convert Packed Single Precision Floating-Point Values to Packed Signed Quadword Integer Values .. | 5-74 |
| VCVTPS2UDQ—Convert Packed Single Precision Floating-Point Values to Packed Unsigned Doubleword Integer Values | 5-76 |
| VCVTPS2UQQ—Convert Packed Single Precision Floating-Point Values to Packed Unsigned Quadword Integer Values | 5-79 |
| VCVTQQ2PD—Convert Packed Quadword Integers to Packed Double Precision Floating-Point Values | 5-81 |
| VCVTQQ2PH—Convert Packed Signed Quadword Integers to Packed FP16 Values | 5-83 |
| VCVTQQ2PS—Convert Packed Quadword Integers to Packed Single Precision Floating-Point Values | 5-85 |
| VCVTSD2SH—Convert Low FP64 Value to an FP16 Value | 5-87 |
| VCVTSD2USI—Convert Scalar Double Precision Floating-Point Value to Unsigned Integer | 5-88 |
| VCVTS2SD—Convert Low FP16 Value to an FP64 Value | 5-90 |
| VCVTS2SI—Convert Low FP16 Value to Signed Integer | 5-91 |
| VCVTS2SS—Convert Low FP16 Value to FP32 Value | 5-93 |
| VCVTS2USI—Convert Low FP16 Value to Unsigned Integer | 5-94 |
| VCVTSI2SH—Convert a Signed Doubleword/Quadword Integer to an FP16 Value | 5-96 |
| VCVTSS2SH—Convert Low FP32 Value to an FP16 Value | 5-98 |
| VCVTSS2USI—Convert Scalar Single Precision Floating-Point Value to Unsigned Doubleword Integer | 5-99 |
| VCVTTPD2QQ—Convert With Truncation Packed Double Precision Floating-Point Values to Packed Quadword Integers | 5-101 |
| VCVTTPD2UDQ—Convert With Truncation Packed Double Precision Floating-Point Values to Packed Unsigned Doubleword Integers | 5-103 |
| VCVTTPD2UQQ—Convert With Truncation Packed Double Precision Floating-Point Values to Packed Unsigned Quadword Integers | 5-105 |
| VCVTTPH2DQ—Convert with Truncation Packed FP16 Values to Signed Doubleword Integers | 5-107 |
| VCVTTPH2QQ—Convert with Truncation Packed FP16 Values to Signed Quadword Integers | 5-109 |
| VCVTTPH2UDQ—Convert with Truncation Packed FP16 Values to Unsigned Doubleword Integers | 5-111 |
| VCVTTPH2UQQ—Convert with Truncation Packed FP16 Values to Unsigned Quadword Integers | 5-113 |
| VCVTTPH2UW—Convert Packed FP16 Values to Unsigned Word Integers | 5-115 |
| VCVTTPH2W—Convert Packed FP16 Values to Signed Word Integers | 5-117 |
| VCVTTPS2QQ—Convert With Truncation Packed Single Precision Floating-Point Values to Packed Signed Quadword Integer Values | 5-119 |
| VCVTTPS2UDQ—Convert With Truncation Packed Single Precision Floating-Point Values to Packed Unsigned Doubleword Integer Values | 5-121 |
| VCVTTPS2UQQ—Convert With Truncation Packed Single Precision Floating-Point Values to Packed Unsigned Quadword Integer Values | 5-123 |
| VCVTTS2USI—Convert With Truncation Scalar Double Precision Floating-Point Value to Unsigned Integer | 5-125 |
| VCVTTS2SI—Convert with Truncation Low FP16 Value to a Signed Integer | 5-127 |
| VCVTTS2USI—Convert with Truncation Low FP16 Value to an Unsigned Integer | 5-128 |
| VCVTSS2USI—Convert With Truncation Scalar Single Precision Floating-Point Value to Unsigned Integer | 5-129 |
| VCVTUDQ2PD—Convert Packed Unsigned Doubleword Integers to Packed Double Precision Floating-Point Values .. | 5-131 |
| VCVTUDQ2PH—Convert Packed Unsigned Doubleword Integers to Packed FP16 Values | 5-133 |
| VCVTUDQ2PS—Convert Packed Unsigned Doubleword Integers to Packed Single Precision Floating-Point Values .. | 5-135 |
| VCVTUQQ2PD—Convert Packed Unsigned Quadword Integers to Packed Double Precision Floating-Point Values .. | 5-138 |
| VCVTUQQ2PH—Convert Packed Unsigned Quadword Integers to Packed FP16 Values | 5-140 |
| VCVTUQQ2PS—Convert Packed Unsigned Quadword Integers to Packed Single Precision Floating-Point Values .. | 5-142 |
| VCVTUSI2SD—Convert Unsigned Integer to Scalar Double Precision Floating-Point Value | 5-144 |
| VCVTUSI2SH—Convert Unsigned Doubleword Integer to an FP16 Value | 5-146 |
| VCVTUSI2SS—Convert Unsigned Integer to Scalar Single Precision Floating-Point Value | 5-148 |
| VCVTUW2PH—Convert Packed Unsigned Word Integers to FP16 Values | 5-150 |
| VCVTW2PH—Convert Packed Signed Word Integers to FP16 Values | 5-152 |
| VDBPSADBW—Double Block Packed Sum-Absolute-Differences (SAD) on Unsigned Bytes | 5-154 |
| VDIVPH—Divide Packed FP16 Values | 5-157 |
| VDIVSH—Divide Scalar FP16 Values | 5-159 |
| VDPBF16PS—Dot Product of BF16 Pairs Accumulated Into Packed Single Precision | 5-160 |

| | |
|--|-------|
| VERR/VERW—Verify a Segment for Reading or Writing | 5-162 |
| VEXPANDPD—Load Sparse Packed Double Precision Floating-Point Values From Dense Memory | 5-164 |
| VEXPANDPS—Load Sparse Packed Single Precision Floating-Point Values From Dense Memory | 5-166 |
| VEXTRACTF128/VEXTRACTF32x4/VEXTRACTF64x2/VEXTRACTF32x8/VEXTRACTF64x4— Extract Packed Floating-Point Values | 5-168 |
| VEXTRACTI128/VEXTRACTI32x4/VEXTRACTI64x2/VEXTRACTI32x8/VEXTRACTI64x4—Extract Packed Integer Values | 5-174 |
| VFCMADDCPH/VFMADDCPH—Complex Multiply and Accumulate FP16 Values | 5-180 |
| VFCMADDCSH/VFMADDCSH—Complex Multiply and Accumulate Scalar FP16 Values | 5-183 |
| VFCMULCPH/VFMULCPH—Complex Multiply FP16 Values | 5-185 |
| VFCMULCSH/VFMULCSH—Complex Multiply Scalar FP16 Values | 5-189 |
| VFIXUPIMMPD—Fix Up Special Packed Float64 Values | 5-191 |
| VFIXUPIMMPS—Fix Up Special Packed Float32 Values | 5-195 |
| VFIXUPIMMSD—Fix Up Special Scalar Float64 Value | 5-199 |
| VFIXUPIMMSS—Fix Up Special Scalar Float32 Value | 5-203 |
| VFMAADD132PD/VFMADD213PD/VFMADD231PD—Fused Multiply-Add of Packed Double Precision Floating-Point Values | 5-207 |
| VF[N]MADD[132,213,231]PH—Fused Multiply-Add of Packed FP16 Values | 5-214 |
| VFMAADD132PS/VFMADD213PS/VFMADD231PS—Fused Multiply-Add of Packed Single Precision Floating-Point Values | 5-220 |
| VFMAADD132SD/VFMADD213SD/VFMADD231SD—Fused Multiply-Add of Scalar Double Precision Floating-Point Values | 5-226 |
| VF[N]MADD[132,213,231]SH—Fused Multiply-Add of Scalar FP16 Values | 5-229 |
| VFMAADD132SS/VFMADD213SS/VFMADD231SS—Fused Multiply-Add of Scalar Single Precision Floating-Point Values | 5-232 |
| VFMAADDSUB132PD/VFMAADDSUB213PD/VFMAADDSUB231PD—Fused Multiply-Alternating Add/Subtract of Packed Double Precision Floating-Point Values | 5-235 |
| VFMAADDSUB132PH/VFMAADDSUB213PH/VFMAADDSUB231PH—Fused Multiply-Alternating Add/Subtract of Packed FP16 Values | 5-243 |
| VFMAADDSUB132PS/VFMAADDSUB213PS/VFMAADDSUB231PS—Fused Multiply-Alternating Add/Subtract of Packed Single Precision Floating-Point Values | 5-248 |
| VFMSUB132PD/VFMSUB213PD/VFMSUB231PD—Fused Multiply-Subtract of Packed Double Precision Floating-Point Values | 5-256 |
| VF[N]MSUB[132,213,231]PH—Fused Multiply-Subtract of Packed FP16 Values | 5-263 |
| VFMSUB132PS/VFMSUB213PS/VFMSUB231PS—Fused Multiply-Subtract of Packed Single Precision Floating-Point Values | 5-269 |
| VFMSUB132SD/VFMSUB213SD/VFMSUB231SD—Fused Multiply-Subtract of Scalar Double Precision Floating-Point Values | 5-276 |
| VF[N]MSUB[132,213,231]SH—Fused Multiply-Subtract of Scalar FP16 Values | 5-279 |
| VFMSUB132SS/VFMSUB213SS/VFMSUB231SS—Fused Multiply-Subtract of Scalar Single Precision Floating-Point Values | 5-282 |
| VFMSUBADD132PD/VFMSUBADD213PD/VFMSUBADD231PD—Fused Multiply-Alternating Subtract/Add of Packed Double Precision Floating-Point Values | 5-285 |
| VFMSUBADD132PH/VFMSUBADD213PH/VFMSUBADD231PH—Fused Multiply-Alternating Subtract/Add of Packed FP16 Values | 5-292 |
| VFMSUBADD132PS/VFMSUBADD213PS/VFMSUBADD231PS—Fused Multiply-Alternating Subtract/Add of Packed Single Precision Floating-Point Values | 5-297 |
| VFNMAADD132PD/VFNMAADD213PD/VFNMAADD231PD—Fused Negative Multiply-Add of Packed Double Precision Floating-Point Values | 5-305 |
| VFNMAADD132PS/VFNMAADD213PS/VFNMAADD231PS—Fused Negative Multiply-Add of Packed Single Precision Floating-Point Values | 5-312 |
| VFNMAADD132SD/VFNMAADD213SD/VFNMAADD231SD—Fused Negative Multiply-Add of Scalar Double Precision Floating-Point Values | 5-319 |
| VFNMAADD132SS/VFNMAADD213SS/VFNMAADD231SS—Fused Negative Multiply-Add of Scalar Single Precision Floating-Point Values | 5-322 |
| VFNMSUB132PD/VFNMSUB213PD/VFNMSUB231PD—Fused Negative Multiply-Subtract of Packed Double Precision Floating-Point Values | 5-325 |
| VFNMSUB132PS/VFNMSUB213PS/VFNMSUB231PS—Fused Negative Multiply-Subtract of Packed Single Precision Floating-Point Values | 5-332 |

| | |
|--|-------|
| VFNMSUB132SD/VFNMSUB213SD/VFNMSUB231SD—Fused Negative Multiply-Subtract of Scalar Double Precision Floating-Point Values | 5-339 |
| VFNMSUB132SS/VFNMSUB213SS/VFNMSUB231SS—Fused Negative Multiply-Subtract of Scalar Single Precision Floating-Point Values | 5-342 |
| VFPCLASSPD—Tests Types of Packed Float64 Values | 5-345 |
| VFPCLASSPH—Test Types of Packed FP16 Values | 5-348 |
| VFPCLASSPS—Tests Types of Packed Float32 Values | 5-351 |
| VFPCLASSSD—Tests Type of a Scalar Float64 Value | 5-353 |
| VFPCLASSSH—Test Types of Scalar FP16 Values | 5-355 |
| VFPCLASSSS—Tests Type of a Scalar Float32 Value | 5-356 |
| VGATHERDPD/VGATHERQPD—Gather Packed Double Precision Floating-Point Values Using Signed Dword/Qword Indices 5-358 | |
| VGATHERDPS/VGATHERDPD—Gather Packed Single, Packed Double with Signed Dword Indices | 5-362 |
| VGATHERDPS/VGATHERQPS—Gather Packed Single Precision Floating-Point Values Using Signed Dword/Qword Indices 5-365 | |
| VGATHERQPS/VGATHERQPD—Gather Packed Single, Packed Double with Signed Qword Indices | 5-369 |
| VGETEXPPD—Convert Exponents of Packed Double Precision Floating-Point Values to Double Precision Floating-Point Values | 5-372 |
| VGETEXPPH—Convert Exponents of Packed FP16 Values to FP16 Values | 5-376 |
| VGETEXPPS—Convert Exponents of Packed Single Precision Floating-Point Values to Single Precision Floating-Point Values 5-379 | |
| VGETEXPSD—Convert Exponents of Scalar Double Precision Floating-Point Value to Double Precision Floating-Point Value 5-383 | |
| VGETEXPSH—Convert Exponents of Scalar FP16 Values to FP16 Values | 5-385 |
| VGETEXPS—Convert Exponents of Scalar Single Precision Floating-Point Value to Single Precision Floating-Point Value 5-387 | |
| VGETMANTPD—Extract Float64 Vector of Normalized Mantissas From Float64 Vector | 5-389 |
| VGETMANTPH—Extract FP16 Vector of Normalized Mantissas from FP16 Vector | 5-393 |
| VGETMANTPS—Extract Float32 Vector of Normalized Mantissas From Float32 Vector | 5-397 |
| VGETMANTSD—Extract Float64 of Normalized Mantissa From Float64 Scalar | 5-400 |
| VGETMANTSH—Extract FP16 of Normalized Mantissa from FP16 Scalar | 5-402 |
| VGETMANTSS—Extract Float32 Vector of Normalized Mantissa From Float32 Scalar | 5-404 |
| VINSERTF128/VINSERTF32x4/VINSERTF64x2/VINSERTF32x8/VINSERTF64x4—Insert Packed Floating-Point Values. 5-406 | |
| VINSERTI128/VINSERTI32x4/VINSERTI64x2/VINSERTI32x8/VINSERTI64x4—Insert Packed Integer Values | 5-411 |
| VMAKMOV—Conditional SIMD Packed Loads and Stores | 5-416 |
| VMAXPH—Return Maximum of Packed FP16 Values | 5-419 |
| VMAXSH—Return Maximum of Scalar FP16 Values | 5-421 |
| VMINPH—Return Minimum of Packed FP16 Values | 5-423 |
| VMINSH—Return Minimum Scalar FP16 Value | 5-425 |
| VMOVSH—Move Scalar FP16 Value | 5-427 |
| VMOVW—Move Word | 5-429 |
| VMULPH—Multiply Packed FP16 Values | 5-430 |
| VMULSH—Multiply Scalar FP16 Values | 5-432 |
| VP2INTERSECTD/VP2INTERSECTQ—Compute Intersection Between DWORDS/QUADWORDS to a Pair of Mask Registers 5-433 | |
| VPBLEND—Blend Packed Dwords | 5-435 |
| VPBLENDMB/VPBLENDMW—Blend Byte/Word Vectors Using an Opmask Control | 5-437 |
| VPBLENDMD/VPBLENDMQ—Blend Int32/Int64 Vectors Using an OpMask Control | 5-439 |
| VPBROADCAST—Load Integer and Broadcast | 5-442 |
| VPBROADCASTB/W/D/Q—Load With Broadcast Integer Data From General Purpose Register | 5-451 |
| VPBROADCASTM—Broadcast Mask to Vector Register | 5-454 |
| VPCMPB/VPCMPUB—Compare Packed Byte Values Into Mask | 5-456 |
| VPCMPD/VPCMPUD—Compare Packed Integer Values Into Mask | 5-459 |
| VPCMPQ/VPCMPUQ—Compare Packed Integer Values Into Mask | 5-462 |
| VPCMPW/VPCMPUW—Compare Packed Word Values Into Mask | 5-465 |
| VPCOMPRESSB/VCOMPRESSW—Store Sparse Packed Byte/Word Integer Values Into Dense Memory/Register ... | 5-468 |
| VPCOMPRESSD—Store Sparse Packed Doubleword Integer Values Into Dense Memory/Register | 5-471 |
| VPCOMPRESSQ—Store Sparse Packed Quadword Integer Values Into Dense Memory/Register | 5-473 |

| | |
|--|-------|
| VPCONFLICTD/Q—Detect Conflicts Within a Vector of Packed Dword/Qword Values Into Dense Memory/ Register | 5-475 |
| VPDPB[SU,UU,SS]D[,S]—Multiply and Add Unsigned and Signed Bytes With and Without Saturation | 5-478 |
| VPDPBUSD—Multiply and Add Unsigned and Signed Bytes | 5-481 |
| VPDPBUSDS—Multiply and Add Unsigned and Signed Bytes With Saturation | 5-484 |
| VPDPWSSD—Multiply and Add Signed Word Integers | 5-487 |
| VPDPWSSDS—Multiply and Add Signed Word Integers With Saturation | 5-489 |
| VPDPW[SU,US,UU]D[,S]—Multiply and Add Unsigned and Signed Words With and Without Saturation | 5-491 |
| VPERM2F128—Permute Floating-Point Values | 5-494 |
| VPERM2I128—Permute Integer Values | 5-496 |
| VPERMB—Permute Packed Bytes Elements | 5-498 |
| VPERMD/VPERMW—Permute Packed Doubleword/Word Elements | 5-500 |
| VPERMI2B—Full Permute of Bytes From Two Tables Overwriting the Index | 5-503 |
| VPERMI2W/D/Q/PS/PD—Full Permute From Two Tables Overwriting the Index | 5-505 |
| VPERMILPD—Permute In-Lane of Pairs of Double Precision Floating-Point Values | 5-511 |
| VPERMILPS—Permute In-Lane of Quadruples of Single Precision Floating-Point Values | 5-517 |
| VPERMPD—Permute Double Precision Floating-Point Elements | 5-522 |
| VPERMPS—Permute Single Precision Floating-Point Elements | 5-526 |
| VPERMQ—Qwords Element Permutation | 5-529 |
| VPERMT2B—Full Permute of Bytes From Two Tables Overwriting a Table | 5-533 |
| VPERMT2W/D/Q/PS/PD—Full Permute From Two Tables Overwriting One Table | 5-535 |
| VPEXPANDB/VPEXPANDW—Expand Byte/Word Values | 5-541 |
| VPEXPANDD—Load Sparse Packed Doubleword Integer Values From Dense Memory/Register | 5-544 |
| VPEXPANDQ—Load Sparse Packed Quadword Integer Values From Dense Memory/Register | 5-546 |
| VPGATHERDD/VPGATHERDQ—Gather Packed Dword, Packed Qword With Signed Dword Indices | 5-548 |
| VPGATHERDD/VPGATHERQD—Gather Packed Dword Values Using Signed Dword/Qword Indices | 5-551 |
| VPGATHERDQ/VPGATHERQQ—Gather Packed Qword Values Using Signed Dword/Qword Indices | 5-555 |
| VPGATHERQD/VPGATHERQQ—Gather Packed Dword, Packed Qword with Signed Qword Indices | 5-559 |
| VPLZCNTD/Q—Count the Number of Leading Zero Bits for Packed Dword, Packed Qword Values | 5-562 |
| VPMADD52HUQ—Packed Multiply of Unsigned 52-Bit Unsigned Integers and Add High 52-Bit Products to 64-Bit Accumulators | 5-565 |
| VPMADD52LUQ—Packed Multiply of Unsigned 52-Bit Integers and Add the Low 52-Bit Products to Qword Accumulators | 5-568 |
| VPMASKMOV—Conditional SIMD Integer Packed Loads and Stores | 5-571 |
| VPMOVB2M/VPMOVW2M/VPMOVD2M/VPMOVQ2M—Convert a Vector Register to a Mask | 5-574 |
| VPMOVDB/VPMOVSDB/VPMOVUSDB—Down Convert DWord to Byte | 5-577 |
| VPMOVDW/VPMOVSDW/VPMOVUSDW—Down Convert DWord to Word | 5-581 |
| VPMOVM2B/VPMOVM2W/VPMOVM2D/VPMOVM2Q—Convert a Mask Register to a Vector Register | 5-585 |
| VPMOVQB/VPMOVSQB/VPMOVUSQB—Down Convert QWord to Byte | 5-588 |
| VPMOVQD/VPMOVSQD/VPMOVUSQD—Down Convert QWord to DWord | 5-592 |
| VPMOVQW/VPMOVSQW/VPMOVUSQW—Down Convert QWord to Word | 5-596 |
| VPMOVWB/VPMOVSWB/VPMOVUSWB—Down Convert Word to Byte | 5-600 |
| VPMULTISHIFTQB—Select Packed Unaligned Bytes From Quadword Sources | 5-604 |
| VPOPCNT—Return the Count of Number of Bits Set to 1 in BYTE/WORD/DWORD/QWORD | 5-606 |
| VPROLD/VPROLVD/VPROLQ/VPROLVQ—Bit Rotate Left | 5-610 |
| VPRORD/VPRORVD/VPRORQ/VPRORVQ—Bit Rotate Right | 5-614 |
| VPSCATTERDD/VPSCATTERDQ/VPSCATTERQD/VPSCATTERQQ—Scatter Packed Dword, Packed Qword with Signed Dword, Signed Qword Indices | 5-618 |
| VPSHLD—Concatenate and Shift Packed Data Left Logical | 5-622 |
| VPSHLDV—Concatenate and Variable Shift Packed Data Left Logical | 5-625 |
| VPSHRD—Concatenate and Shift Packed Data Right Logical | 5-628 |
| VPSHRDV—Concatenate and Variable Shift Packed Data Right Logical | 5-631 |
| VPSHUFBITQMB—Shuffle Bits From Quadword Elements Using Byte Indexes Into Mask | 5-634 |
| VPSLLVW/VPSLLVD/VPSLLVQ—Variable Bit Shift Left Logical | 5-636 |
| VPSRAVW/VPSRAVD/VPSRAVQ—Variable Bit Shift Right Arithmetic | 5-641 |
| VPSRLVW/VPSRLVD/VPSRLVQ—Variable Bit Shift Right Logical | 5-646 |
| VPTERNLOGD/VPTERNLOGQ—Bitwise Ternary Logic | 5-651 |
| VPTESTMB/VPTESTMW/VPTESTMD/VPTESTMQ—Logical AND and Set Mask | 5-654 |
| VPTESTNMB/W/D/Q—Logical NAND and Set | 5-657 |
| VRANGEPD—Range Restriction Calculation for Packed Pairs of Float64 Values | 5-661 |

| | |
|---|-------|
| VRANGEPS—Range Restriction Calculation for Packed Pairs of Float32 Values | 5-665 |
| VRANGESD—Range Restriction Calculation From a Pair of Scalar Float64 Values | 5-668 |
| VRANGESS—Range Restriction Calculation From a Pair of Scalar Float32 Values | 5-671 |
| VRCP14PD—Compute Approximate Reciprocals of Packed Float64 Values | 5-674 |
| VRCP14PS—Compute Approximate Reciprocals of Packed Float32 Values | 5-676 |
| VRCP14SD—Compute Approximate Reciprocal of Scalar Float64 Value | 5-678 |
| VRCP14SS—Compute Approximate Reciprocal of Scalar Float32 Value | 5-680 |
| VRCPPH—Compute Reciprocals of Packed FP16 Values | 5-682 |
| VRCPSH—Compute Reciprocal of Scalar FP16 Value | 5-684 |
| VREDUCEPD—Perform Reduction Transformation on Packed Float64 Values | 5-685 |
| VREDUCEPH—Perform Reduction Transformation on Packed FP16 Values | 5-688 |
| VREDUCEPS—Perform Reduction Transformation on Packed Float32 Values | 5-691 |
| VREDUCESD—Perform a Reduction Transformation on a Scalar Float64 Value | 5-693 |
| VREDUCESH—Perform Reduction Transformation on Scalar FP16 Value | 5-695 |
| VREDUCESS—Perform a Reduction Transformation on a Scalar Float32 Value | 5-697 |
| VRNDSCALEPD—Round Packed Float64 Values to Include a Given Number of Fraction Bits | 5-699 |
| VRNDSCALEPH—Round Packed FP16 Values to Include a Given Number of Fraction Bits | 5-702 |
| VRNDSCALEPS—Round Packed Float32 Values to Include a Given Number of Fraction Bits | 5-705 |
| VRNDSCALESD—Round Scalar Float64 Value to Include a Given Number of Fraction Bits | 5-708 |
| VRNDSCALESH—Round Scalar FP16 Value to Include a Given Number of Fraction Bits | 5-710 |
| VRNDSCALESS—Round Scalar Float32 Value to Include a Given Number of Fraction Bits | 5-712 |
| VRSQRT14PD—Compute Approximate Reciprocals of Square Roots of Packed Float64 Values | 5-714 |
| VRSQRT14PS—Compute Approximate Reciprocals of Square Roots of Packed Float32 Values | 5-716 |
| VRSQRT14SD—Compute Approximate Reciprocal of Square Root of Scalar Float64 Value | 5-718 |
| VRSQRT14SS—Compute Approximate Reciprocal of Square Root of Scalar Float32 Value | 5-720 |
| VRSQRTPH—Compute Reciprocals of Square Roots of Packed FP16 Values | 5-722 |
| VRSQRTSH—Compute Approximate Reciprocal of Square Root of Scalar FP16 Value | 5-724 |
| VSCALEFPD—Scale Packed Float64 Values With Float64 Values | 5-725 |
| VSCALEFPH—Scale Packed FP16 Values with FP16 Values | 5-728 |
| VSCALEFPS—Scale Packed Float32 Values With Float32 Values | 5-731 |
| VSCALEFSD—Scale Scalar Float64 Values With Float64 Values | 5-734 |
| VSCALEFSH—Scale Scalar FP16 Values with FP16 Values | 5-736 |
| VSCALEFSS—Scale Scalar Float32 Value With Float32 Value | 5-738 |
| VSCATTERDPS/VSCATTERDPD/VSCATTERQPS/VSCATTERQPD—Scatter Packed Single Precision, Packed Double Precision Floating-Point Values with Signed Dword and Qword Indices | 5-740 |
| VSHA512MSG1—Perform an Intermediate Calculation for the Next Four SHA512 Message Qwords | 5-744 |
| VSHA512MSG2—Perform a Final Calculation for the Next Four SHA512 Message Qwords | 5-746 |
| VSHA512RND2—Perform Two Rounds of SHA512 Operation | 5-748 |
| VSHUFF32x4/VSHUFF64x2/VSHUFF32x4/VSHUFF64x2—Shuffle Packed Values at 128-Bit Granularity | 5-750 |
| VSM3MSG1—Perform Initial Calculation for the Next Four SM3 Message Words | 5-755 |
| VSM3MSG2—Perform Final Calculation for the Next Four SM3 Message Words | 5-757 |
| VSM3RND2—Perform Two Rounds of SM3 Operation | 5-759 |
| VSM4KEY4—Perform Four Rounds of SM4 Key Expansion | 5-761 |
| VSM4RND4—Performs Four Rounds of SM4 Encryption | 5-763 |
| VSQRTPH—Compute Square Root of Packed FP16 Values | 5-765 |
| VSQRTSH—Compute Square Root of Scalar FP16 Value | 5-767 |
| VSUBPH—Subtract Packed FP16 Values | 5-768 |
| VSUBSH—Subtract Scalar FP16 Value | 5-770 |
| VTESTPD/VTESTPS—Packed Bit Test | 5-771 |
| VUCOMISH—Unordered Compare Scalar FP16 Values and Set EFLAGS | 5-774 |
| VZEROALL—Zero XMM, YMM, and ZMM Registers | 5-775 |
| VZERoupper—Zero Upper Bits of YMM and ZMM Registers | 5-776 |

CHAPTER 6

INSTRUCTION SET REFERENCE, W-Z

| | |
|---|-----|
| 6.1 INSTRUCTIONS (W-Z) | 6-1 |
| WAIT/FWAIT—Wait | 6-1 |
| WBINVD—Write Back and Invalidate Cache | 6-2 |
| WBNOINVD—Write Back and Do Not Invalidate Cache | 6-4 |

| | |
|--|------|
| WRFSBASE/WRGSBASE—Write FS/GS Segment Base | 6-6 |
| WRMSR—Write to Model Specific Register | 6-8 |
| WRMSRLIST—Write List of Model Specific Registers | 6-10 |
| WRMSRNS—Non-Serializing Write to Model Specific Register | 6-12 |
| WRPKRU—Write Data to User Page Key Register | 6-14 |
| WRSSD/WRSSQ—Write to Shadow Stack | 6-16 |
| WRUSSD/WRUSSQ—Write to User Shadow Stack | 6-18 |
| XABORT—Transactional Abort | 6-20 |
| XACQUIRE/XRELEASE—Hardware Lock Elision Prefix Hints | 6-22 |
| XADD—Exchange and Add | 6-26 |
| XBEGIN—Transactional Begin | 6-28 |
| XCHG—Exchange Register/Memory With Register | 6-31 |
| XEND—Transactional End | 6-33 |
| XGETBV—Get Value of Extended Control Register | 6-35 |
| XLAT/XLATB—Table Look-up Translation | 6-37 |
| XOR—Logical Exclusive OR | 6-39 |
| XORPD—Bitwise Logical XOR of Packed Double Precision Floating-Point Values | 6-41 |
| XORPS—Bitwise Logical XOR of Packed Single Precision Floating-Point Values | 6-44 |
| XRESLDTK—Resume Tracking Load Addresses | 6-47 |
| XRSTOR—Restore Processor Extended States | 6-48 |
| XRSTORS—Restore Processor Extended States Supervisor | 6-53 |
| XSAVE—Save Processor Extended States | 6-57 |
| XSAVEC—Save Processor Extended States With Compaction | 6-60 |
| XSAVEOPT—Save Processor Extended States Optimized | 6-63 |
| XSAVES—Save Processor Extended States Supervisor | 6-66 |
| XSETBV—Set Extended Control Register | 6-69 |
| XSUSLDTK—Suspend Tracking Load Addresses | 6-71 |
| XTEST—Test if in Transactional Execution | 6-72 |

CHAPTER 7

SAFER MODE EXTENSIONS REFERENCE

| | | |
|---------|--|------|
| 7.1 | OVERVIEW | 7-1 |
| 7.2 | SMX FUNCTIONALITY | 7-1 |
| 7.2.1 | Detecting and Enabling SMX | 7-1 |
| 7.2.2 | SMX Instruction Summary | 7-2 |
| 7.2.2.1 | GETSEC[CAPABILITIES] | 7-3 |
| 7.2.2.2 | GETSEC[ENTERACCS] | 7-3 |
| 7.2.2.3 | GETSEC[EXITAC] | 7-3 |
| 7.2.2.4 | GETSEC[SENDER] | 7-4 |
| 7.2.2.5 | GETSEC[SEXIT] | 7-4 |
| 7.2.2.6 | GETSEC[PARAMETERS] | 7-4 |
| 7.2.2.7 | GETSEC[SMCTRL] | 7-4 |
| 7.2.2.8 | GETSEC[WAKEUP] | 7-4 |
| 7.2.3 | Measured Environment and SMX | 7-5 |
| 7.3 | GETSEC LEAF FUNCTIONS | 7-5 |
| | GETSEC[CAPABILITIES]—Report the SMX Capabilities | 7-7 |
| | GETSEC[ENTERACCS]—Execute Authenticated Chipset Code | 7-10 |
| | GETSEC[EXITAC]—Exit Authenticated Code Execution Mode | 7-18 |
| | GETSEC[SENDER]—Enter a Measured Environment | 7-21 |
| | GETSEC[SEXIT]—Exit Measured Environment | 7-30 |
| | GETSEC[PARAMETERS]—Report the SMX Parameters | 7-33 |
| | GETSEC[SMCTRL]—SMX Mode Control | 7-37 |
| | GETSEC[WAKEUP]—Wake Up Sleeping Processors in Measured Environment | 7-40 |

CHAPTER 8

INSTRUCTION SET REFERENCE UNIQUE TO INTEL® XEON PHI™ PROCESSORS

| | |
|--|-----|
| PREFETCHWT1—Prefetch Vector Data Into Caches With Intent to Write and T1 Hint | 8-2 |
| V4FMADDPS/V4FNMADDPS—Packed Single Precision Floating-Point Fused Multiply-Add (4-Iterations) | 8-4 |
| V4FMADDSS/V4FNMADDSS—Scalar Single Precision Floating-Point Fused Multiply-Add | |

| | |
|---|------|
| (4-Iterations) | 8-6 |
| VEXP2PD—Approximation to the Exponential 2^x of Packed Double Precision Floating-Point Values With Less Than 2^{-23} Relative Error | 8-8 |
| VEXP2PS—Approximation to the Exponential 2^x of Packed Single Precision Floating-Point Values With Less Than 2^{-23} Relative Error | 8-10 |
| VGATHERPF0DPS/VGATHERPF0QPS/VGATHERPF0DPD/VGATHERPF0QPD—Sparse Prefetch Packed SP/DP Data Values With Signed Dword, Signed Qword Indices Using T0 Hint | 8-12 |
| VGATHERPF1DPS/VGATHERPF1QPS/VGATHERPF1DPD/VGATHERPF1QPD—Sparse Prefetch Packed SP/DP Data Values With Signed Dword, Signed Qword Indices Using T1 Hint | 8-14 |
| VP4DPWSSDS—Dot Product of Signed Words With Dword Accumulation and Saturation (4-Iterations) | 8-16 |
| VP4DPWSSD—Dot Product of Signed Words With Dword Accumulation (4-Iterations) | 8-18 |
| VRCP28PD—Approximation to the Reciprocal of Packed Double Precision Floating-Point Values With Less Than 2^{-28} Relative Error | 8-20 |
| VRCP28SD—Approximation to the Reciprocal of Scalar Double Precision Floating-Point Value With Less Than 2^{-28} Relative Error | 8-22 |
| VRCP28PS—Approximation to the Reciprocal of Packed Single Precision Floating-Point Values With Less Than 2^{-28} Relative Error | 8-24 |
| VRCP28SS—Approximation to the Reciprocal of Scalar Single Precision Floating-Point Value With Less Than 2^{-28} Relative Error | 8-26 |
| VRSQRT28PD—Approximation to the Reciprocal Square Root of Packed Double Precision Floating-Point Values With Less Than 2^{-28} Relative Error | 8-28 |
| VRSQRT28SD—Approximation to the Reciprocal Square Root of Scalar Double Precision Floating-Point Value With Less Than 2^{-28} Relative Error | 8-30 |
| VRSQRT28PS—Approximation to the Reciprocal Square Root of Packed Single Precision Floating-Point Values With Less Than 2^{-28} Relative Error | 8-32 |
| VRSQRT28SS—Approximation to the Reciprocal Square Root of Scalar Single Precision Floating-Point Value With Less Than 2^{-28} Relative Error | 8-34 |
| VSCATTERPF0DPS/VSCATTERPF0QPS/VSCATTERPF0DPD/VSCATTERPF0QPD—Sparse Prefetch Packed SP/DP Data Values with Signed Dword, Signed Qword Indices Using T0 Hint With Intent to Write | 8-36 |
| VSCATTERPF1DPS/VSCATTERPF1QPS/VSCATTERPF1DPD/VSCATTERPF1QPD—Sparse Prefetch Packed SP/DP Data Values With Signed Dword, Signed Qword Indices Using T1 Hint With Intent to Write | 8-38 |

APPENDIX A OPCODE MAP

| | | |
|---------|--|------|
| A.1 | USING OPCODE TABLES | A-1 |
| A.2 | KEY TO ABBREVIATIONS | A-1 |
| A.2.1 | Codes for Addressing Method | A-1 |
| A.2.2 | Codes for Operand Type | A-2 |
| A.2.3 | Register Codes | A-3 |
| A.2.4 | Opcode Look-up Examples for One, Two, and Three-Byte Opcodes | A-3 |
| A.2.4.1 | One-Byte Opcode Instructions | A-3 |
| A.2.4.2 | Two-Byte Opcode Instructions | A-4 |
| A.2.4.3 | Three-Byte Opcode Instructions | A-5 |
| A.2.4.4 | VEX Prefix Instructions | A-5 |
| A.2.5 | Superscripts Utilized in Opcode Tables | A-6 |
| A.3 | ONE, TWO, AND THREE-BYTE OPCODE MAPS | A-6 |
| A.4 | OPCODE EXTENSIONS FOR ONE-BYTE AND TWO-BYTE OPCODES | A-17 |
| A.4.1 | Opcode Look-up Examples Using Opcode Extensions | A-17 |
| A.4.2 | Opcode Extension Tables | A-17 |
| A.5 | ESCAPE OPCODE INSTRUCTIONS | A-20 |
| A.5.1 | Opcode Look-up Examples for Escape Instruction Opcodes | A-20 |
| A.5.2 | Escape Opcode Instruction Tables | A-20 |
| A.5.2.1 | Escape Opcodes with D8 as First Byte | A-20 |
| A.5.2.2 | Escape Opcodes with D9 as First Byte | A-21 |
| A.5.2.3 | Escape Opcodes with DA as First Byte | A-22 |
| A.5.2.4 | Escape Opcodes with DB as First Byte | A-23 |
| A.5.2.5 | Escape Opcodes with DC as First Byte | A-24 |
| A.5.2.6 | Escape Opcodes with DD as First Byte | A-25 |
| A.5.2.7 | Escape Opcodes with DE as First Byte | A-26 |
| A.5.2.8 | Escape Opcodes with DF As First Byte | A-27 |

APPENDIX B**INSTRUCTION FORMATS AND ENCODINGS**

| | | |
|---------|---|-------|
| B.1 | MACHINE INSTRUCTION FORMAT..... | B-1 |
| B.1.1 | Legacy Prefixes..... | B-1 |
| B.1.2 | REX Prefixes..... | B-2 |
| B.1.3 | Opcode Fields..... | B-2 |
| B.1.4 | Special Fields..... | B-2 |
| B.1.4.1 | Reg Field (reg) for Non-64-Bit Modes..... | B-3 |
| B.1.4.2 | Reg Field (reg) for 64-Bit Mode..... | B-4 |
| B.1.4.3 | Encoding of Operand Size (w) Bit..... | B-4 |
| B.1.4.4 | Sign-Extend (s) Bit..... | B-5 |
| B.1.4.5 | Segment Register (sreg) Field..... | B-5 |
| B.1.4.6 | Special-Purpose Register (eee) Field..... | B-5 |
| B.1.4.7 | Condition Test (tttn) Field..... | B-6 |
| B.1.4.8 | Direction (d) Bit..... | B-6 |
| B.1.5 | Other Notes..... | B-6 |
| B.2 | GENERAL-PURPOSE INSTRUCTION FORMATS AND ENCODINGS FOR NON-64-BIT MODES..... | B-7 |
| B.2.1 | General Purpose Instruction Formats and Encodings for 64-Bit Mode..... | B-18 |
| B.3 | PENTIUM® PROCESSOR FAMILY INSTRUCTION FORMATS AND ENCODINGS..... | B-37 |
| B.4 | 64-BIT MODE INSTRUCTION ENCODINGS FOR SIMD INSTRUCTION EXTENSIONS..... | B-37 |
| B.5 | MMX INSTRUCTION FORMATS AND ENCODINGS..... | B-38 |
| B.5.1 | Granularity Field (gg)..... | B-38 |
| B.5.2 | MMX Technology and General-Purpose Register Fields (mmxreg and reg)..... | B-38 |
| B.5.3 | MMX Instruction Formats and Encodings Table..... | B-38 |
| B.6 | PROCESSOR EXTENDED STATE INSTRUCTION FORMATS AND ENCODINGS..... | B-41 |
| B.7 | P6 FAMILY INSTRUCTION FORMATS AND ENCODINGS..... | B-41 |
| B.8 | SSE INSTRUCTION FORMATS AND ENCODINGS..... | B-42 |
| B.9 | SSE2 INSTRUCTION FORMATS AND ENCODINGS..... | B-47 |
| B.9.1 | Granularity Field (gg)..... | B-47 |
| B.10 | SSE3 FORMATS AND ENCODINGS TABLE..... | B-57 |
| B.11 | SSSE3 FORMATS AND ENCODING TABLE..... | B-58 |
| B.12 | AESNI AND PCLMULQDQ INSTRUCTION FORMATS AND ENCODINGS..... | B-60 |
| B.13 | SPECIAL ENCODINGS FOR 64-BIT MODE..... | B-61 |
| B.14 | SSE4.1 FORMATS AND ENCODING TABLE..... | B-64 |
| B.15 | SSE4.2 FORMATS AND ENCODING TABLE..... | B-69 |
| B.16 | AVX FORMATS AND ENCODING TABLE..... | B-70 |
| B.17 | FLOATING-POINT INSTRUCTION FORMATS AND ENCODINGS..... | B-108 |
| B.18 | VMX INSTRUCTIONS..... | B-112 |
| B.19 | SMX INSTRUCTIONS..... | B-113 |

APPENDIX C**INTEL® C/C++ COMPILER INTRINSICS AND FUNCTIONAL EQUIVALENTS**

| | | |
|-----|---------------------------|------|
| C.1 | SIMPLE INTRINSICS..... | C-2 |
| C.2 | COMPOSITE INTRINSICS..... | C-14 |

The Intel® 64 and IA-32 Architectures Software Developer's Manual, Volumes 2A, 2B, 2C, & 2D: Instruction Set Reference (order numbers 253666, 253667, 326018, and 334569), is part of a set that describes the architecture and programming environment of all Intel 64 and IA-32 architecture processors. Other volumes in this set are:

- The Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1: Basic Architecture (Order Number 253665).
- The Intel® 64 and IA-32 Architectures Software Developer's Manual, Volumes 3A, 3B, 3C, & 3D: System Programming Guide (order numbers 253668, 253669, 326019, and 332831).
- The Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4: Model-Specific Registers (order number 335592).

The Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, describes the basic architecture and programming environment of Intel 64 and IA-32 processors. The Intel® 64 and IA-32 Architectures Software Developer's Manual, Volumes 2A, 2B, 2C, & 2D, describes the instruction set of the processor and the opcode structure. These volumes apply to application programmers and to programmers who write operating systems or executives. The Intel® 64 and IA-32 Architectures Software Developer's Manual, Volumes 3A, 3B, 3C, & 3D, describes the operating-system support environment of Intel 64 and IA-32 processors. These volumes target operating-system and BIOS designers. In addition, the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B, addresses the programming environment for classes of software that host operating systems. The Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4, describes the model-specific registers of Intel 64 and IA-32 processors.

1.1 OVERVIEW OF VOLUME 2A, 2B, 2C, AND 2D: INSTRUCTION SET REFERENCE

A description of Intel® 64 and IA-32 Architectures Software Developer's Manual, Volumes 2A, 2B, 2C, & 2D, content follows:

Chapter 1 — About This Manual. Gives an overview of all volumes of the Intel® 64 and IA-32 Architectures Software Developer's Manual, with chapter-specific details for the current volume.

Chapter 2 — Instruction Format. Describes the machine-level instruction format used for all IA-32 instructions and gives the allowable encodings of prefixes, the operand-identifier byte (ModR/M byte), the addressing-mode specifier byte (SIB byte), and the displacement and immediate bytes.

Chapter 3 — Instruction Set Reference, A-L. Describes Intel 64 and IA-32 instructions in detail, including an algorithmic description of operations, the effect on flags, the effect of operand- and address-size attributes, and the exceptions that may be generated. The instructions are arranged in alphabetical order. General-purpose, x87 FPU, Intel MMX™ technology, SSE/SSE2/SSE3/SSSE3/SSE4 extensions, and system instructions are included.

Chapter 4 — Instruction Set Reference, M-U. Continues the description of Intel 64 and IA-32 instructions started in Chapter 3. It starts Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2B.

Chapter 5 — Instruction Set Reference, V. Continues the description of Intel 64 and IA-32 instructions started in chapters 3 and 4. This chapter starts Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2C.

Chapter 6 — Instruction Set Reference, W-Z. Continues the description of Intel 64 and IA-32 instructions started in chapters 3, 4, and 5. It provides the balance of the alphabetized list of instructions and starts Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2D.

Chapter 7 — Safer Mode Extensions Reference. Describes the safer mode extensions (SMX). SMX is intended for a system executive to support launching a measured environment in a platform where the identity of the software controlling the platform hardware can be measured for the purpose of making trust decisions.

Chapter 8— Instruction Set Reference Unique to Intel® Xeon Phi™ Processors. Describes the instruction set that is unique to Intel® Xeon Phi™ processors based on the Knights Landing and Knights Mill microarchitectures. The set is not supported in any other Intel processors.

Appendix A — Opcode Map. Gives an opcode map for the IA-32 instruction set.

Appendix B — Instruction Formats and Encodings. Gives the binary encoding of each form of each IA-32 instruction.

Appendix C — Intel® C/C++ Compiler Intrinsics and Functional Equivalents. Lists the Intel® C/C++ compiler intrinsics and their assembly code equivalents for each of the IA-32 MMX and SSE/SSE2/SSE3 instructions.

This chapter describes the instruction format for all Intel 64 and IA-32 processors. The instruction format for protected mode, real-address mode and virtual-8086 mode is described in Section 2.1. Increments provided for IA-32e mode and its sub-modes are described in Section 2.2.

2.1 INSTRUCTION FORMAT FOR PROTECTED MODE, REAL-ADDRESS MODE, AND VIRTUAL-8086 MODE

The Intel 64 and IA-32 architectures instruction encodings are subsets of the format shown in Figure 2-1. Instructions consist of optional instruction prefixes (in any order), primary opcode bytes (up to three bytes), an addressing-form specifier (if required) consisting of the ModR/M byte and sometimes the SIB (Scale-Index-Base) byte, a displacement (if required), and an immediate data field (if required).

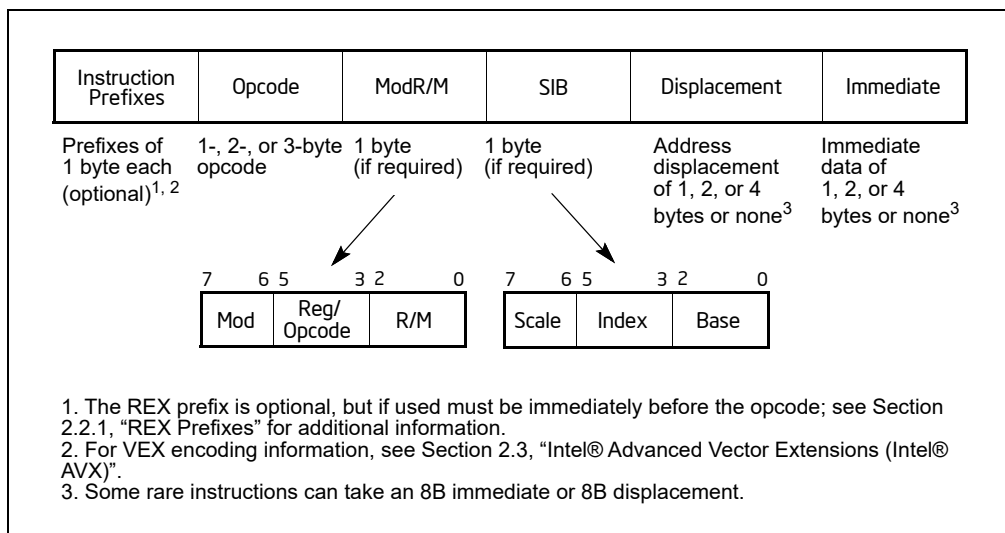

Figure 2-1. Intel 64 and IA-32 Architectures Instruction Format

2.1.1 Instruction Prefixes

Instruction prefixes are divided into four groups, each with a set of allowable prefix codes. For each instruction, it is only useful to include up to one prefix code from each of the four groups (Groups 1, 2, 3, 4). Groups 1 through 4 may be placed in any order relative to each other.

- Group 1
 - Lock and repeat prefixes:
 - LOCK prefix is encoded using F0H.
 - REPNE/REPZ prefix is encoded using F2H. Repeat-Not-Zero prefix applies only to string and input/output instructions. (F2H is also used as a mandatory prefix for some instructions.)
 - REP or REPE/REPZ is encoded using F3H. The repeat prefix applies only to string and input/output instructions. (F3H is also used as a mandatory prefix for some instructions.)

- BND prefix is encoded using F2H if the following conditions are true:
 - CPUID.(EAX=07H, ECX=0):EBX.MPX[bit 14] is set.
 - BNDCFGU.EN and/or IA32_BNDCFGS.EN is set.
 - When the F2 prefix precedes a near CALL, a near RET, a near JMP, a short Jcc, or a near Jcc instruction (see Appendix E, “Intel® Memory Protection Extensions,” of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1).
- Group 2
 - Segment override prefixes:
 - 2EH—CS segment override (use with any branch instruction is reserved).
 - 36H—SS segment override prefix (use with any branch instruction is reserved).
 - 3EH—DS segment override prefix (use with any branch instruction is reserved).
 - 26H—ES segment override prefix (use with any branch instruction is reserved).
 - 64H—FS segment override prefix (use with any branch instruction is reserved).
 - 65H—GS segment override prefix (use with any branch instruction is reserved).
 - Branch hints¹:
 - 2EH—Branch not taken (used only with Jcc instructions).
 - 3EH—Branch taken (used only with Jcc instructions).
- Group 3
 - Operand-size override prefix is encoded using 66H (66H is also used as a mandatory prefix for some instructions).
- Group 4
 - 67H—Address-size override prefix.

The LOCK prefix (F0H) forces an operation that ensures exclusive use of shared memory in a multiprocessor environment. See “LOCK—Assert LOCK# Signal Prefix” in Chapter 3, “Instruction Set Reference, A-L,” for a description of this prefix.

Repeat prefixes (F2H, F3H) cause an instruction to be repeated for each element of a string. Use these prefixes only with string and I/O instructions (MOVS, CMPS, SCAS, LODS, STOS, INS, and OUTS). Use of repeat prefixes and/or undefined opcodes with other Intel 64 or IA-32 instructions is reserved; such use may cause unpredictable behavior.

Some instructions may use F2H or F3H as a mandatory prefix to express distinct functionality.

Branch hint prefixes (2EH, 3EH) allow a program to give a hint to the processor about the most likely code path for a branch when used on conditional branch instructions (Jcc).

The operand-size override prefix allows a program to switch between 16- and 32-bit operand sizes. Either size can be the default; use of the prefix selects the non-default size.

Some SSE2/SSE3/SSSE3/SSE4 instructions and instructions using a three-byte sequence of primary opcode bytes may use 66H as a mandatory prefix to express distinct functionality.

Other use of the 66H prefix is reserved; such use may cause unpredictable behavior.

The address-size override prefix (67H) allows programs to switch between 16- and 32-bit addressing. Either size can be the default; the prefix selects the non-default size. Using this prefix and/or other undefined opcodes when operands for the instruction do not reside in memory is reserved; such use may cause unpredictable behavior.

2.1.2 Opcodes

A primary opcode can be 1, 2, or 3 bytes in length. An additional 3-bit opcode field is sometimes encoded in the ModR/M byte. Smaller fields can be defined within the primary opcode. Such fields define the direction of operation,

1. Microarchitectural behavior varies; refer to the Intel® 64 and IA-32 Architectures Optimization Reference Manual.

size of displacements, register encoding, condition codes, or sign extension. Encoding fields used by an opcode vary depending on the class of operation.

Two-byte opcode formats for general-purpose and SIMD instructions consist of one of the following:

- An escape opcode byte 0FH as the primary opcode and a second opcode byte.
- A mandatory prefix (66H, F2H, or F3H), an escape opcode byte, and a second opcode byte (same as previous bullet).

For example, CVTQ2PD consists of the following sequence: F3 0F E6. The first byte is a mandatory prefix (it is not considered as a repeat prefix).

Three-byte opcode formats for general-purpose and SIMD instructions consist of one of the following:

- An escape opcode byte 0FH as the primary opcode, plus two additional opcode bytes.
- A mandatory prefix (66H, F2H, or F3H), an escape opcode byte, plus two additional opcode bytes (same as previous bullet).

For example, PHADDW for XMM registers consists of the following sequence: 66 0F 38 01. The first byte is the mandatory prefix.

Valid opcode expressions are defined in Appendix A and Appendix B.

2.1.3 ModR/M and SIB Bytes

Many instructions that refer to an operand in memory have an addressing-form specifier byte (called the ModR/M byte) following the primary opcode. The ModR/M byte contains three fields of information:

- The *mod* field combines with the *r/m* field to form 32 possible values: eight registers and 24 addressing modes.
- The *reg/opcode* field specifies either a register number or three more bits of opcode information. The purpose of the *reg/opcode* field is specified in the primary opcode.
- The *r/m* field can specify a register as an operand or it can be combined with the *mod* field to encode an addressing mode. Sometimes, certain combinations of the *mod* field and the *r/m* field are used to express opcode information for some instructions.

Certain encodings of the ModR/M byte require a second addressing byte (the SIB byte). The base-plus-index and scale-plus-index forms of 32-bit addressing require the SIB byte. The SIB byte includes the following fields:

- The *scale* field specifies the scale factor.
- The *index* field specifies the register number of the index register.
- The *base* field specifies the register number of the base register.

See Section 2.1.5 for the encodings of the ModR/M and SIB bytes.

2.1.4 Displacement and Immediate Bytes

Some addressing forms include a displacement immediately following the ModR/M byte (or the SIB byte if one is present). If a displacement is required, it can be 1, 2, or 4 bytes.

If an instruction specifies an immediate operand, the operand always follows any displacement bytes. An immediate operand can be 1, 2 or 4 bytes.

2.1.5 Addressing-Mode Encoding of ModR/M and SIB Bytes

The values and corresponding addressing forms of the ModR/M and SIB bytes are shown in Table 2-1 through Table 2-3: 16-bit addressing forms specified by the ModR/M byte are in Table 2-1 and 32-bit addressing forms are in Table 2-2. Table 2-3 shows 32-bit addressing forms specified by the SIB byte. In cases where the *reg/opcode* field in the ModR/M byte represents an extended opcode, valid encodings are shown in Appendix B.

In Table 2-1 and Table 2-2, the Effective Address column lists 32 effective addresses that can be assigned to the first operand of an instruction by using the Mod and R/M fields of the ModR/M byte. The first 24 options provide ways of specifying a memory location; the last eight (Mod = 11B) provide ways of specifying general-purpose, MMX technology and XMM registers.

The Mod and R/M columns in Table 2-1 and Table 2-2 give the binary encodings of the Mod and R/M fields required to obtain the effective address listed in the first column. For example: see the row indicated by Mod = 11B, R/M = 000B. The row identifies the general-purpose registers EAX, AX or AL; MMX technology register MM0; or XMM register XMM0. The register used is determined by the opcode byte and the operand-size attribute.

Now look at the seventh row in either table (labeled "REG ="). This row specifies the use of the 3-bit Reg/Opcode field when the field is used to give the location of a second operand. The second operand must be a general-purpose, MMX technology, or XMM register. Rows one through five list the registers that may correspond to the value in the table. Again, the register used is determined by the opcode byte along with the operand-size attribute.

If the instruction does not require a second operand, then the Reg/Opcode field may be used as an opcode extension. This use is represented by the sixth row in the tables (labeled "/digit (Opcode)"). Note that values in row six are represented in decimal form.

The body of Table 2-1 and Table 2-2 (under the label "Value of ModR/M Byte (in Hexadecimal)") contains a 32 by 8 array that presents all of 256 values of the ModR/M byte (in hexadecimal). Bits 3, 4, and 5 are specified by the column of the table in which a byte resides. The row specifies bits 0, 1, and 2; and bits 6 and 7. The figure below demonstrates interpretation of one table value.

NOTES:

1. The default segment register is SS for the effective addresses containing a BP index, DS for other effective addresses.
2. The disp16 nomenclature denotes a 16-bit displacement that follows the ModR/M byte and that is added to the index.
3. The disp8 nomenclature denotes an 8-bit displacement that follows the ModR/M byte and that is sign-extended and added to the index.

NOTES:

1. The [--][--] nomenclature means a SIB follows the ModR/M byte.
2. The disp32 nomenclature denotes a 32-bit displacement that follows the ModR/M byte (or the SIB byte if one is present) and that is added to the index.
3. The disp8 nomenclature denotes an 8-bit displacement that follows the ModR/M byte (or the SIB byte if one is present) and that is sign-extended and added to the index.

Table 2-3 is organized to give 256 possible values of the SIB byte (in hexadecimal). General purpose registers used as a base are indicated across the top of the table, along with corresponding values for the SIB byte's base field. Table rows in the body of the table indicate the register used as the index (SIB byte bits 3, 4, and 5) and the scaling factor (determined by SIB byte bits 6 and 7).

Table 2-3. 32-Bit Addressing Forms with the SIB Byte

| r32 (In decimal) Base = (In binary) Base = | | | EAX 0 000 | ECX 1 001 | EDX 2 010 | EBX 3 011 | ESP 4 100 | [*] 5 101 | ESI 6 110 | EDI 7 111 |

NOTES:

- The [*] nomenclature means a disp32 with no base if the MOD is 00B. Otherwise, [*] means disp8 or disp32 + [EBP]. This provides the following address modes:

MOD bits Effective Address

- | | |
|----|---------------------------------|
| 00 | [scaled index] + disp32 |
| 01 | [scaled index] + disp8 + [EBP] |
| 10 | [scaled index] + disp32 + [EBP] |

2.2 IA-32E MODE

IA-32e mode has two sub-modes. These are:

- Compatibility Mode.** Enables a 64-bit operating system to run most legacy protected mode software unmodified.
- 64-Bit Mode.** Enables a 64-bit operating system to run applications written to access 64-bit address space.

2.2.1 REX Prefixes

REX prefixes are instruction-prefix bytes used in 64-bit mode. They do the following:

- Specify GPRs and SSE registers.

- Specify 64-bit operand size.
- Specify extended control registers.

Not all instructions require a REX prefix in 64-bit mode. A REX prefix is necessary only if an instruction references one of the extended registers or one of the byte registers SPL, BPL, SIL, DIL; or uses a 64-bit operand. A REX prefix is ignored, as are its individual bits, when it is not needed for an instruction or when it does not immediately precede the opcode byte or the escape opcode byte (0FH) of an instruction for which it is needed. This has the implication that only one REX prefix, properly located, can affect an instruction.

When a REX prefix is used in conjunction with an instruction containing a mandatory prefix, the mandatory prefix must come before the REX so the REX prefix can immediately precede the opcode or the escape byte. For example, CVTQ2PD with a REX prefix should have REX placed between F3 and 0F E6. Other placements are ignored. The instruction-size limit of 15 bytes still applies to instructions with a REX prefix. See Figure 2-3.

| Legacy Prefixes | REX Prefix | Opcode | ModR/M | SIB | Displacement | Immediate |
|---------------------------------------|------------|--------------------------|----------------------|----------------------|--|--|
| Grp 1, Grp 2, Grp 3, Grp 4 (optional) | (optional) | 1-, 2-, or 3-byte opcode | 1 byte (if required) | 1 byte (if required) | Address displacement of 1, 2, or 4 bytes | Immediate data of 1, 2, or 4 bytes or none |

Figure 2-3. Prefix Ordering in 64-bit Mode

2.2.1.1 Encoding

Intel 64 and IA-32 instruction formats specify up to three registers by using 3-bit fields in the encoding, depending on the format:

- ModR/M: the reg and r/m fields of the ModR/M byte.
- ModR/M with SIB: the reg field of the ModR/M byte, the base and index fields of the SIB (scale, index, base) byte.
- Instructions without ModR/M: the reg field of the opcode.

In 64-bit mode, these formats do not change. Bits needed to define fields in the 64-bit context are provided by the addition of REX prefixes.

2.2.1.2 More on REX Prefix Fields

REX prefixes are a set of 16 opcodes that span one row of the opcode map and occupy entries 40H to 4FH. These opcodes represent valid instructions (INC or DEC) in IA-32 operating modes and in compatibility mode. In 64-bit mode, the same opcodes represent the instruction prefix REX and are not treated as individual instructions.

The single-byte-opcode forms of the INC/DEC instructions are not available in 64-bit mode. INC/DEC functionality is still available using ModR/M forms of the same instructions (opcodes FF/0 and FF/1).

See Table 2-4 for a summary of the REX prefix format. Figure 2-4 through Figure 2-7 show examples of REX prefix fields in use. Some combinations of REX prefix fields are invalid. In such cases, the prefix is ignored. Some additional information follows:

- Setting REX.W can be used to determine the operand size but does not solely determine operand width. Like the 66H size prefix, 64-bit operand size override has no effect on byte-specific operations.
- For non-byte operations: if a 66H prefix is used with prefix (REX.W = 1), 66H is ignored.
- If a 66H override is used with REX and REX.W = 0, the operand size is 16 bits.
- REX.R modifies the ModR/M reg field when that field encodes a GPR, SSE, control or debug register. REX.R is ignored when ModR/M specifies other registers or defines an extended opcode.
- REX.X bit modifies the SIB index field.

- REX.B either modifies the base in the ModR/M r/m field or SIB base field; or it modifies the opcode reg field used for accessing GPRs.

Table 2-4. REX Prefix Fields [BITS: 0100WRXB]

| Field Name | Bit Position | Definition |
|------------|--------------|--|
| - | 7:4 | 0100 |
| W | 3 | 0 = Operand size determined by CS.D 1 = 64 Bit Operand Size |
| R | 2 | Extension of the ModR/M reg field |
| X | 1 | Extension of the SIB index field |
| B | 0 | Extension of the ModR/M r/m field, SIB base field, or Opcode reg field |

**Figure 2-4. Memory Addressing Without an SIB Byte; REX.X Not Used****Figure 2-5. Register-Register Addressing (No Memory Operand); REX.X Not Used**

Figure 2-6. Memory Addressing With a SIB Byte

Figure 2-7. Register Operand Coded in Opcode Byte; REX.X & REX.R Not Used

In the IA-32 architecture, byte registers (AH, AL, BH, BL, CH, CL, DH, and DL) are encoded in the ModR/M byte's reg field, the r/m field or the opcode reg field as registers 0 through 7. REX prefixes provide an additional addressing capability for byte-registers that makes the least-significant byte of GPRs available for byte operations. Certain combinations of the fields of the ModR/M byte and the SIB byte have special meaning for register encodings. For some combinations, fields expanded by the REX prefix are not decoded. Table 2-5 describes how each case behaves.

Table 2-5. Special Cases of REX Encodings

| ModR/M or SIB | Sub-field Encodings | Compatibility Mode Operation | Compatibility Mode Implications | Additional Implications |
|---------------|---------------------|------------------------------|--|--|
| ModR/M Byte | mod ? 11 | SIB byte present. | SIB byte required for ESP-based addressing. | REX prefix adds a fourth bit (b) which is not decoded (don't care). SIB byte also required for R12-based addressing. |
| | r/m = b*100(ESP) | | | |
| ModR/M Byte | mod = 0 | Base register not used. | EBP without a displacement must be done using mod = 01 with displacement of 0. | REX prefix adds a fourth bit (b) which is not decoded (don't care). Using RBP or R13 without displacement must be done using mod = 01 with a displacement of 0. |
| | r/m = b*101(EBP) | | | |
| SIB Byte | index = 0100(ESP) | Index register not used. | ESP cannot be used as an index register. | REX prefix adds a fourth bit (b) which is decoded. There are no additional implications. The expanded index field allows distinguishing RSP from R12, therefore R12 can be used as an index. |

Table 2-5. Special Cases of REX Encodings (Contd.)

| ModR/M or SIB | Sub-field Encodings | Compatibility Mode Operation | Compatibility Mode Implications | Additional Implications |
|---------------|---------------------|-------------------------------------|--|--|
| SIB Byte | base = 0101(EBP) | Base register is unused if mod = 0. | Base register depends on mod encoding. | REX prefix adds a fourth bit (b) which is not decoded. This requires explicit displacement to be used with EBP/RBP or R13. |

NOTES:

* Don't care about value of REX.B

2.2.1.3 Displacement

Addressing in 64-bit mode uses existing 32-bit ModR/M and SIB encodings. The ModR/M and SIB displacement sizes do not change. They remain 8 bits or 32 bits and are sign-extended to 64 bits.

2.2.1.4 Direct Memory-Offset MOVs

In 64-bit mode, direct memory-offset forms of the MOV instruction are extended to specify a 64-bit immediate absolute address. This address is called a moffset. No prefix is needed to specify this 64-bit memory offset. For these MOV instructions, the size of the memory offset follows the address-size default (64 bits in 64-bit mode). See Table 2-6.

Table 2-6. Direct Memory Offset Form of MOV

| Opcode | Instruction |
|--------|------------------|
| A0 | MOV AL, moffset |
| A1 | MOV EAX, moffset |
| A2 | MOV moffset, AL |
| A3 | MOV moffset, EAX |

2.2.1.5 Immediates

In 64-bit mode, the typical size of immediate operands remains 32 bits. When the operand size is 64 bits, the processor sign-extends all immediates to 64 bits prior to their use.

Support for 64-bit immediate operands is accomplished by expanding the semantics of the existing move (MOV reg, imm16/32) instructions. These instructions (opcodes B8H – BFH) move 16-bits or 32-bits of immediate data (depending on the effective operand size) into a GPR. When the effective operand size is 64 bits, these instructions can be used to load an immediate into a GPR. A REX prefix is needed to override the 32-bit default operand size to a 64-bit operand size.

For example:

```
48 B8 8877665544332211 MOV RAX,1122334455667788H
```

2.2.1.6 RIP-Relative Addressing

A new addressing form, RIP-relative (relative instruction-pointer) addressing, is implemented in 64-bit mode. An effective address is formed by adding displacement to the 64-bit RIP of the next instruction.

In IA-32 architecture and compatibility mode, addressing relative to the instruction pointer is available only with control-transfer instructions. In 64-bit mode, instructions that use ModR/M addressing can use RIP-relative addressing. Without RIP-relative addressing, all ModR/M modes address memory relative to zero.

RIP-relative addressing allows specific ModR/M modes to address memory relative to the 64-bit RIP using a signed 32-bit displacement. This provides an offset range of $\pm 2\text{GB}$ from the RIP. Table 2-7 shows the ModR/M and SIB encodings for RIP-relative addressing. Redundant forms of 32-bit displacement-addressing exist in the current ModR/M and SIB encodings. There is one ModR/M encoding and there are several SIB encodings. RIP-relative addressing is encoded using a redundant form.

In 64-bit mode, the ModR/M Disp32 (32-bit displacement) encoding is re-defined to be RIP+Disp32 rather than displacement-only. See Table 2-7.

Table 2-7. RIP-Relative Addressing

| ModR/M and SIB Sub-field Encodings | | Compatibility Mode Operation | 64-bit Mode Operation | Additional Implications in 64-bit mode |
|------------------------------------|--------------------|------------------------------|-----------------------|--|
| ModR/M Byte | mod = 00 | Disp32 | RIP + Disp32 | In 64-bit mode, if one wants to use a Disp32 without specifying a base register, one can use a SIB byte encoding (indicated by ModR/M.r/m=100) as described in the next row. |
| | r/m = 101 (none) | | | |
| SIB Byte | base = 101 (none) | If mod = 00, Disp32 | Same as legacy | None |
| | index = 100 (none) | | | |
| | scale = 0, 1, 2, 4 | | | |

The ModR/M encoding for RIP-relative addressing does not depend on using a prefix. Specifically, the r/m bit field encoding of 101B (used to select RIP-relative addressing) is not affected by the REX prefix. For example, selecting R13 (REX.B = 1, r/m = 101B) with mod = 00B still results in RIP-relative addressing. The 4-bit r/m field of REX.B combined with ModR/M is not fully decoded. In order to address R13 with no displacement, software must encode R13 + 0 using a 1-byte displacement of zero.

RIP-relative addressing is enabled by 64-bit mode, not by a 64-bit address-size. The use of the address-size prefix does not disable RIP-relative addressing. The effect of the address-size prefix is to truncate and zero-extend the computed effective address to 32 bits.

2.2.1.7 Default 64-Bit Operand Size

In 64-bit mode, two groups of instructions have a default operand size of 64 bits (do not need a REX prefix for this operand size). These are:

- Near branches.
- All instructions, except far branches, that implicitly reference the RSP.

2.2.2 Additional Encodings for Control and Debug Registers

In 64-bit mode, more encodings for control and debug registers are available. The REX.R bit is used to modify the ModR/M reg field when that field encodes a control or debug register (see Table 2-4). These encodings enable the processor to address CR8-CR15 and DR8-DR15. An additional control register (CR8) is defined in 64-bit mode. CR8 becomes the Task Priority Register (TPR).

In the first implementation of IA-32e mode, CR9-CR15 and DR8-DR15 are not implemented. Any attempt to access unimplemented registers results in an invalid-opcode exception (#UD).

2.3 INTEL® ADVANCED VECTOR EXTENSIONS (INTEL® AVX)

Intel AVX instructions are encoded using an encoding scheme that combines prefix bytes, opcode extension field, operand encoding fields, and vector length encoding capability into a new prefix, referred to as VEX. In the VEX encoding scheme, the VEX prefix may be two or three bytes long, depending on the instruction semantics. Despite the two-byte or three-byte length of the VEX prefix, the VEX encoding format provides a more compact representation/packing of the components of encoding an instruction in Intel 64 architecture. The VEX encoding scheme also allows more headroom for future growth of Intel 64 architecture.

2.3.1 Instruction Format

Instruction encoding using VEX prefix provides several advantages:

- Instruction syntax support for three operands and up-to four operands when necessary. For example, the third source register used by VBLENDVPD is encoded using bits 7:4 of the immediate byte.
- Encoding support for vector length of 128 bits (using XMM registers) and 256 bits (using YMM registers).
- Encoding support for instruction syntax of non-destructive source operands.
- Elimination of escape opcode byte (0FH), SIMD prefix byte (66H, F2H, F3H) via a compact bit field representation within the VEX prefix.
- Elimination of the need to use REX prefix to encode the extended half of general-purpose register sets (R8-R15) for direct register access, memory addressing, or accessing XMM8-XMM15 (including YMM8-ymm15).
- Flexible and more compact bit fields are provided in the VEX prefix to retain the full functionality provided by REX prefix. REX.W, REX.X, REX.B functionalities are provided in the three-byte VEX prefix only because only a subset of SIMD instructions need them.
- Extensibility for future instruction extensions without significant instruction length increase.

Figure 2-8 shows the Intel 64 instruction encoding format with VEX prefix support. Legacy instruction without a VEX prefix is fully supported and unchanged. The use of VEX prefix in an Intel 64 instruction is optional, but a VEX prefix is required for Intel 64 instructions that operate on YMM registers or support three and four operand syntax. VEX prefix is not a constant-valued, “single-purpose” byte like 0FH, 66H, F2H, F3H in legacy SSE instructions. VEX prefix provides substantially richer capability than the REX prefix.

Figure 2-8. Instruction Encoding Format with VEX Prefix

2.3.2 VEX and the LOCK prefix

Any VEX-encoded instruction with a LOCK prefix preceding VEX will #UD.

2.3.3 VEX and the 66H, F2H, and F3H prefixes

Any VEX-encoded instruction with a 66H, F2H, or F3H prefix preceding VEX will #UD.

2.3.4 VEX and the REX prefix

Any VEX-encoded instruction with a REX prefix proceeding VEX will #UD.

2.3.5 The VEX Prefix

The VEX prefix is encoded in either the two-byte form (the first byte must be C5H) or in the three-byte form (the first byte must be C4H). The two-byte VEX is used mainly for 128-bit, scalar, and the most common 256-bit AVX instructions; while the three-byte VEX provides a compact replacement of REX and 3-byte opcode instructions (including AVX and FMA instructions). Beyond the first byte of the VEX prefix, it consists of a number of bit fields providing specific capability, they are shown in Figure 2-9.

The bit fields of the VEX prefix can be summarized by its functional purposes:

- Non-destructive source register encoding (applicable to three and four operand syntax): This is the first source operand in the instruction syntax. It is represented by the notation, VEX.vvvv. This field is encoded using 1’s complement form (inverted form), i.e., XMM0/YMM0/R0 is encoded as 1111B, XMM15/YMM15/R15 is encoded as 0000B.

- Vector length encoding: This 1-bit field represented by the notation VEX.L. L= 0 means vector length is 128 bits wide, L=1 means 256 bit vector. The value of this field is written as VEX.128 or VEX.256 in this document to distinguish encoded values of other VEX bit fields.
- REX prefix functionality: Full REX prefix functionality is provided in the three-byte form of VEX prefix. However the VEX bit fields providing REX functionality are encoded using 1's complement form, i.e., XMM0/YMM0/R0 is encoded as 1111B, XMM15/YMM15/R15 is encoded as 0000B.
 - Two-byte form of the VEX prefix only provides the equivalent functionality of REX.R, using 1's complement encoding. This is represented as VEX.R.
 - Three-byte form of the VEX prefix provides REX.R, REX.X, REX.B functionality using 1's complement encoding and three dedicated bit fields represented as VEX.R, VEX.X, VEX.B.
 - Three-byte form of the VEX prefix provides the functionality of REX.W only to specific instructions that need to override default 32-bit operand size for a general purpose register to 64-bit size in 64-bit mode. For those applicable instructions, VEX.W field provides the same functionality as REX.W. VEX.W field can provide completely different functionality for other instructions.

Consequently, the use of REX prefix with VEX encoded instructions is not allowed. However, the intent of the REX prefix for expanding register set is reserved for future instruction set extensions using VEX prefix encoding format.

- Compaction of SIMD prefix: Legacy SSE instructions effectively use SIMD prefixes (66H, F2H, F3H) as an opcode extension field. VEX prefix encoding allows the functional capability of such legacy SSE instructions (operating on XMM registers, bits 255:128 of corresponding YMM unmodified) to be encoded using the VEX.pp field without the presence of any SIMD prefix. The VEX-encoded 128-bit instruction will zero-out bits 255:128 of the destination register. VEX-encoded instruction may have 128 bit vector length or 256 bits length.
- Compaction of two-byte and three-byte opcode: More recently introduced legacy SSE instructions employ two and three-byte opcode. The one or two leading bytes are: 0FH, and 0FH 3AH/0FH 38H. The one-byte escape (0FH) and two-byte escape (0FH 3AH, 0FH 38H) can also be interpreted as an opcode extension field. The VEX.mmmmm field provides compaction to allow many legacy instruction to be encoded without the constant byte sequence, 0FH, 0FH 3AH, 0FH 38H. These VEX-encoded instruction may have 128 bit vector length or 256 bits length.

The VEX prefix is required to be the last prefix and immediately precedes the opcode bytes. It must follow any other prefixes. If VEX prefix is present a REX prefix is not supported.

The 3-byte VEX leaves room for future expansion with 3 reserved bits. REX and the 66h/F2h/F3h prefixes are reclaimed for future use.

VEX prefix has a two-byte form and a three byte form. If an instruction syntax can be encoded using the two-byte form, it can also be encoded using the three byte form of VEX. The latter increases the length of the instruction by one byte. This may be helpful in some situations for code alignment.

The VEX prefix supports 256-bit versions of floating-point SSE, SSE2, SSE3, and SSE4 instructions. Note, certain new instruction functionality can only be encoded with the VEX prefix.

The VEX prefix will #UD on any instruction containing MMX register sources or destinations.

R: REX.R in 1's complement (inverted) form
 1: Same as REX.R=0 (must be 1 in 32-bit mode)
 0: Same as REX.R=1 (64-bit mode only)

X: REX.X in 1's complement (inverted) form
 1: Same as REX.X=0 (must be 1 in 32-bit mode)
 0: Same as REX.X=1 (64-bit mode only)

B: REX.B in 1's complement (inverted) form
 1: Same as REX.B=0 (Ignored in 32-bit mode).
 0: Same as REX.B=1 (64-bit mode only)

W: opcode specific (use like REX.W, or used for opcode extension, or ignored, depending on the opcode byte)

m-mmmm:

00000: Reserved for future use (will #UD)
 00001: implied 0F leading opcode byte
 00010: implied 0F 38 leading opcode bytes
 00011: implied 0F 3A leading opcode bytes
 00100-11111: Reserved for future use (will #UD)

vvvv: a register specifier (in 1's complement form) or 1111 if unused.

L: Vector Length

0: scalar or 128-bit vector
 1: 256-bit vector

pp: opcode extension providing equivalent functionality of a SIMD prefix

00: None
 01: 66
 10: F3
 11: F2

Figure 2-9. VEX bit fields

The following subsections describe the various fields in two or three-byte VEX prefix.

2.3.5.1 VEX Byte 0, bits[7:0]

VEX Byte 0, bits [7:0] must contain the value 11000101b (C5h) or 11000100b (C4h). The 3-byte VEX uses the C4h first byte, while the 2-byte VEX uses the C5h first byte.

2.3.5.2 VEX Byte 1, bit [7] - 'R'

VEX Byte 1, bit [7] contains a bit analogous to a bit inverted REX.R. In protected and compatibility modes the bit must be set to '1' otherwise the instruction is LES or LDS.

This bit is present in both 2- and 3-byte VEX prefixes.

The usage of WRXB bits for legacy instructions is explained in detail section 2.2.1.2 of Intel 64 and IA-32 Architectures Software developer's manual, Volume 2A.

This bit is stored in bit inverted format.

2.3.5.3 3-byte VEX byte 1, bit[6] - 'X'

Bit[6] of the 3-byte VEX byte 1 encodes a bit analogous to a bit inverted REX.X. It is an extension of the SIB Index field in 64-bit modes. In 32-bit modes, this bit must be set to '1' otherwise the instruction is LES or LDS.

This bit is available only in the 3-byte VEX prefix.

This bit is stored in bit inverted format.

2.3.5.4 3-byte VEX byte 1, bit[5] - 'B'

Bit[5] of the 3-byte VEX byte 1 encodes a bit analogous to a bit inverted REX.B. In 64-bit modes, it is an extension of the ModR/M r/m field, or the SIB base field. In 32-bit modes, this bit is ignored.

This bit is available only in the 3-byte VEX prefix.

This bit is stored in bit inverted format.

2.3.5.5 3-byte VEX byte 2, bit[7] - 'W'

Bit[7] of the 3-byte VEX byte 2 is represented by the notation VEX.W. It can provide following functions, depending on the specific opcode.

- For AVX instructions that have equivalent legacy SSE instructions (typically these SSE instructions have a general-purpose register operand with its operand size attribute promotable by REX.W), if REX.W promotes the operand size attribute of the general-purpose register operand in legacy SSE instruction, VEX.W has same meaning in the corresponding AVX equivalent form. In 32-bit modes for these instructions, VEX.W is silently ignored.
- For AVX instructions that have equivalent legacy SSE instructions (typically these SSE instructions have operands with their operand size attribute fixed and not promotable by REX.W), if REX.W is don't care in legacy SSE instruction, VEX.W is ignored in the corresponding AVX equivalent form irrespective of mode.
- For new AVX instructions where VEX.W has no defined function (typically these meant the combination of the opcode byte and VEX.mmmmm did not have any equivalent SSE functions), VEX.W is reserved as zero and setting to other than zero will cause instruction to #UD.

2.3.5.6 2-byte VEX Byte 1, bits[6:3] and 3-byte VEX Byte 2, bits [6:3]- 'vvvv' the Source or Dest Register Specifier

In 32-bit mode the VEX first byte C4 and C5 alias onto the LES and LDS instructions. To maintain compatibility with existing programs the VEX 2nd byte, bits [7:6] must be 11b. To achieve this, the VEX payload bits are selected to place only inverted, 64-bit valid fields (extended register selectors) in these upper bits.

The 2-byte VEX Byte 1, bits [6:3] and the 3-byte VEX, Byte 2, bits [6:3] encode a field (shorthand VEX.vvvv) that for instructions with 2 or more source registers and an XMM or YMM or memory destination encodes the first source register specifier stored in inverted (1's complement) form.

VEX.vvvv is not used by the instructions with one source (except certain shifts, see below) or on instructions with no XMM or YMM or memory destination. If an instruction does not use VEX.vvvv then it should be set to 1111b otherwise instruction will #UD.

In 64-bit mode all 4 bits may be used. See Table for the encoding of the XMM or YMM registers. In 32-bit and 16-bit modes bit 6 must be 1 (if bit 6 is not 1, the 2-byte VEX version will generate LDS instruction and the 3-byte VEX version will ignore this bit).

Table 2-8. VEX.vvvv to Register Name Mapping

| VEX.vvvv | Dest Register | General-Purpose Register (If Applicable) ¹ | Valid in Legacy/Compatibility 32-bit modes? ² |
|----------|---------------|---|--|
| 1111B | XMM0/YMM0 | RAX/EAX | Valid |
| 1110B | XMM1/YMM1 | RCX/ECX | Valid |
| 1101B | XMM2/YMM2 | RDX/EDX | Valid |
| 1100B | XMM3/YMM3 | RBX/EBX | Valid |
| 1011B | XMM4/YMM4 | RSP/ESP | Valid |
| 1010B | XMM5/YMM5 | RBP/EBP | Valid |
| 1001B | XMM6/YMM6 | RSI/ESI | Valid |
| 1000B | XMM7/YMM7 | RDI/EDI | Valid |
| 0111B | XMM8/YMM8 | R8/R8D | Invalid |
| 0110B | XMM9/YMM9 | R9/R9D | Invalid |
| 0101B | XMM10/YMM10 | R10/R10D | Invalid |
| 0100B | XMM11/YMM11 | R11/R11D | Invalid |
| 0011B | XMM12/YMM12 | R12/R12D | Invalid |
| 0010B | XMM13/YMM13 | R13/R13D | Invalid |
| 0001B | XMM14/YMM14 | R14/R14D | Invalid |
| 0000B | XMM15/YMM15 | R15/R15D | Invalid |

NOTES:

1. See Section 2.6, “VEX Encoding Support for GPR Instructions” for additional details.

2. Only the first eight General-Purpose Registers are accessible/encodable in 16/32b modes.

The VEX.vvvv field is encoded in bit inverted format for accessing a register operand.

2.3.6 Instruction Operand Encoding and VEX.vvvv, ModR/M

VEX-encoded instructions support three-operand and four-operand instruction syntax. Some VEX-encoded instructions have syntax with less than three operands, e.g., VEX-encoded pack shift instructions support one source operand and one destination operand).

The roles of VEX.vvvv, reg field of ModR/M byte (ModR/M.reg), r/m field of ModR/M byte (ModR/M.r/m) with respect to encoding destination and source operands vary with different type of instruction syntax.

The role of VEX.vvvv can be summarized to three situations:

- VEX.vvvv encodes the first source register operand, specified in inverted (1’s complement) form and is valid for instructions with 2 or more source operands.
- VEX.vvvv encodes the destination register operand, specified in 1’s complement form for certain vector shifts. The instructions where VEX.vvvv is used as a destination are listed in Table 2-9. The notation in the “Opcode” column in Table 2-9 is described in detail in section 3.1.1.
- VEX.vvvv does not encode any operand, the field is reserved and should contain 1111b.

Table 2-9. Instructions with a VEX.vvvv Destination

| Opcode | Instruction mnemonic |
|------------------------|--------------------------|
| VEX.128.66.0F 73 /7 ib | VPSLLDQ xmm1, xmm2, imm8 |
| VEX.128.66.0F 73 /3 ib | VPSRLDQ xmm1, xmm2, imm8 |

Table 2-9. Instructions with a VEX.vvvv Destination (Contd.)

| Opcode | Instruction mnemonic |
|------------------------|-------------------------|
| VEX.128.66.0F 71 /2 ib | VPSRLW xmm1, xmm2, imm8 |
| VEX.128.66.0F 72 /2 ib | VPSRLD xmm1, xmm2, imm8 |
| VEX.128.66.0F 73 /2 ib | VPSRLQ xmm1, xmm2, imm8 |
| VEX.128.66.0F 71 /4 ib | VPSRAW xmm1, xmm2, imm8 |
| VEX.128.66.0F 72 /4 ib | VPSRAD xmm1, xmm2, imm8 |
| VEX.128.66.0F 71 /6 ib | VPSLLW xmm1, xmm2, imm8 |
| VEX.128.66.0F 72 /6 ib | VPSLLD xmm1, xmm2, imm8 |
| VEX.128.66.0F 73 /6 ib | VPSLLQ xmm1, xmm2, imm8 |

The role of ModR/M.r/m field can be summarized to two situations:

- ModR/M.r/m encodes the instruction operand that references a memory address.
- For some instructions that do not support memory addressing semantics, ModR/M.r/m encodes either the destination register operand or a source register operand.

The role of ModR/M.reg field can be summarized to two situations:

- ModR/M.reg encodes either the destination register operand or a source register operand.
- For some instructions, ModR/M.reg is treated as an opcode extension and not used to encode any instruction operand.

For instruction syntax that support four operands, VEX.vvvv, ModR/M.r/m, ModR/M.reg encodes three of the four operands. The role of bits 7:4 of the immediate byte serves the following situation:

- Imm8[7:4] encodes the third source register operand.

2.3.6.1 3-byte VEX byte 1, bits[4:0] - “m-mmmm”

Bits[4:0] of the 3-byte VEX byte 1 encode an implied leading opcode byte (0F, 0F 38, or 0F 3A). Several bits are reserved for future use and will #UD unless 0.

Table 2-10. VEX.m-mmmm Interpretation

| VEX.m-mmmm | Implied Leading Opcode Bytes |
|--------------|------------------------------|
| 00000B | Reserved |
| 00001B | 0F |
| 00010B | 0F 38 |
| 00011B | 0F 3A |
| 00100-11111B | Reserved |
| (2-byte VEX) | 0F |

VEX.m-mmmm is only available on the 3-byte VEX. The 2-byte VEX implies a leading 0Fh opcode byte.

2.3.6.2 2-byte VEX byte 1, bit[2], and 3-byte VEX byte 2, bit [2]- “L”

The vector length field, VEX.L, is encoded in bit[2] of either the second byte of 2-byte VEX, or the third byte of 3-byte VEX. If “VEX.L = 1”, it indicates 256-bit vector operation. “VEX.L = 0” indicates scalar and 128-bit vector operations.

The instruction VZEROUPPER is a special case that is encoded with VEX.L = 0, although its operation zero’s bits 255:128 of all YMM registers accessible in the current operating mode. See Table 2-11.

Table 2-11. VEX.L Interpretation

| VEX.L | Vector Length |
|-------|-------------------------------|
| 0 | 128-bit (or 32/64-bit scalar) |
| 1 | 256-bit |

2.3.6.3 2-byte VEX byte 1, bits[1:0], and 3-byte VEX byte 2, bits [1:0]- “pp”

Up to one implied prefix is encoded by bits[1:0] of either the 2-byte VEX byte 1 or the 3-byte VEX byte 2. The prefix behaves as if it was encoded prior to VEX, but after all other encoded prefixes. See Table 2-12.

Table 2-12. VEX.pp Interpretation

| pp | Implies this prefix after other prefixes but before VEX |
|-----|---|
| 00B | None |
| 01B | 66 |
| 10B | F3 |
| 11B | F2 |

2.3.7 The Opcode Byte

One (and only one) opcode byte follows the 2 or 3 byte VEX. Legal opcodes are specified in Appendix B, in color. Any instruction that uses illegal opcode will #UD.

2.3.8 The ModR/M, SIB, and Displacement Bytes

The encodings are unchanged but the interpretation of reg_field or rm_field differs (see above).

2.3.9 The Third Source Operand (Immediate Byte)

VEX-encoded instructions can support instruction with a four operand syntax. VBLENDVPD, VBLENDVPS, and PBLENDVB use imm8[7:4] to encode one of the source registers.

2.3.10 Intel® AVX Instructions and the Upper 128-bits of YMM registers

If an instruction with a destination XMM register is encoded with a VEX prefix, the processor zeroes the upper bits (above bit 128) of the equivalent YMM register. Legacy SSE instructions without VEX preserve the upper bits.

2.3.10.1 Vector Length Transition and Programming Considerations

An instruction encoded with a VEX.128 prefix that loads a YMM register operand operates as follows:

- Data is loaded into bits 127:0 of the register
- Bits above bit 127 in the register are cleared.

Thus, such an instruction clears bits 255:128 of a destination YMM register on processors with a maximum vector-register width of 256 bits. In the event that future processors extend the vector registers to greater widths, an instruction encoded with a VEX.128 or VEX.256 prefix will also clear any bits beyond bit 255. (This is in contrast with legacy SSE instructions, which have no VEX prefix; these modify only bits 127:0 of any destination register operand.)

Programmers should bear in mind that instructions encoded with VEX.128 and VEX.256 prefixes will clear any future extensions to the vector registers. A calling function that uses such extensions should save their state before calling legacy functions. This is not possible for involuntary calls (e.g., into an interrupt-service routine). It is

recommended that software handling involuntary calls accommodate this by not executing instructions encoded with VEX.128 and VEX.256 prefixes. In the event that it is not possible or desirable to restrict these instructions, then software must take special care to avoid actions that would, on future processors, zero the upper bits of vector registers.

Processors that support further vector-register extensions (defining bits beyond bit 255) will also extend the XSAVE and XRSTOR instructions to save and restore these extensions. To ensure forward compatibility, software that handles involuntary calls and that uses instructions encoded with VEX.128 and VEX.256 prefixes should first save and then restore the vector registers (with any extensions) using the XSAVE and XRSTOR instructions with save/restore masks that set bits that correspond to all vector-register extensions. Ideally, software should rely on a mechanism that is cognizant of which bits to set. (E.g., an OS mechanism that sets the save/restore mask bits for all vector-register extensions that are enabled in XCR0.) Saving and restoring state with instructions other than XSAVE and XRSTOR will, on future processors with wider vector registers, corrupt the extended state of the vector registers - even if doing so functions correctly on processors supporting 256-bit vector registers. (The same is true if XSAVE and XRSTOR are used with a save/restore mask that does not set bits corresponding to all supported extensions to the vector registers.)

2.3.11 Intel® AVX Instruction Length

The Intel AVX instructions described in this document (including VEX and ignoring other prefixes) do not exceed 11 bytes in length, but may increase in the future. The maximum length of an Intel 64 and IA-32 instruction remains 15 bytes.

2.3.12 Vector SIB (VSIB) Memory Addressing

In Intel® Advanced Vector Extensions 2 (Intel® AVX2), an SIB byte that follows the ModR/M byte can support VSIB memory addressing to an array of linear addresses. VSIB addressing is only supported in a subset of Intel AVX2 instructions. VSIB memory addressing requires 32-bit or 64-bit effective address. In 32-bit mode, VSIB addressing is not supported when address size attribute is overridden to 16 bits. In 16-bit protected mode, VSIB memory addressing is permitted if address size attribute is overridden to 32 bits. Additionally, VSIB memory addressing is supported only with VEX prefix.

In VSIB memory addressing, the SIB byte consists of:

- The scale field (bit 7:6) specifies the scale factor.
- The index field (bits 5:3) specifies the register number of the vector index register, each element in the vector register specifies an index.
- The base field (bits 2:0) specifies the register number of the base register.

Table 2-13 shows the 32-bit VSIB addressing form. It is organized to give 256 possible values of the SIB byte (in hexadecimal). General purpose registers used as a base are indicated across the top of the table, along with corresponding values for the SIB byte's base field. The register names also include R8D-R15D applicable only in 64-bit mode (when address size override prefix is used, but the value of VEX.B is not shown in Table 2-13). In 32-bit mode, R8D-R15D does not apply.

Table rows in the body of the table indicate the vector index register used as the index field and each supported scaling factor shown separately. Vector registers used in the index field can be XMM or YMM registers. The left-most column includes vector registers VR8-VR15 (i.e., XMM8/YMM8-XMM15/YMM15), which are only available in 64-bit mode and does not apply if encoding in 32-bit mode.

Table 2-13. 32-Bit VSIB Addressing Forms of the SIB Byte

| r32 (In decimal) Base = (In binary) Base = | | | | EAX/ R8D 0 000 | ECX/ R9D 1 001 | EDX/ R10D 2 010 | EBX/ R11D 3 011 | ESP/ R12D 4 100 | EBP/ R13D ¹ 5 101 | ESI/ R14D 6 110 | EDI/ R15D 7 111 |

NOTES:

1. If ModR/M.mod = 00b, the base address is zero, then effective address is computed as [scaled vector index] + disp32. Otherwise the base address is computed as [EBP/R13]+ disp, the displacement is either 8 bit or 32 bit depending on the value of ModR/M.mod:

| MOD | Effective Address |
|-----|---|
| 00b | [Scaled Vector Register] + Disp32 |
| 01b | [Scaled Vector Register] + Disp8 + [EBP/R13] |
| 10b | [Scaled Vector Register] + Disp32 + [EBP/R13] |

2.3.12.1 64-bit Mode VSIB Memory Addressing

In 64-bit mode VSIB memory addressing uses the VEX.B field and the base field of the SIB byte to encode one of the 16 general-purpose register as the base register. The VEX.X field and the index field of the SIB byte encode one of the 16 vector registers as the vector index register.

In 64-bit mode the top row of Table 2-13 base register should be interpreted as the full 64-bit of each register.

2.4 INTEL® ADVANCED MATRIX EXTENSIONS (INTEL® AMX)

Intel® AMX instructions follow the general documentation convention established in previous sections. Additionally, Intel® Advanced Matrix Extensions use notation conventions as described below.

In the instruction encoding boxes, **sibmem** is used to denote an encoding where a ModR/M byte and SIB byte are used to indicate a memory operation where the base and displacement are used to point to memory, and the index

register (if present) is used to denote a stride between memory rows. The index register is scaled by the sib.scale field as usual. The base register is added to the displacement, if present.

In the instruction encoding, the ModR/M byte is represented several ways depending on the role it plays. The ModR/M byte has 3 fields: 2-bit ModR/M.mod field, a 3-bit ModR/M.reg field and a 3-bit ModR/M.r/m field. When all bits of the ModR/M byte have fixed values for an instruction, the 2-hex nibble value of that byte is presented after the opcode in the encoding boxes on the instruction description pages. When only some fields of the ModR/M byte must contain fixed values, those values are specified as follows:

- If only the ModR/M.mod must be 0b11, and ModR/M.reg and ModR/M.r/m fields are unrestricted, this is denoted as **11:rrr:bbb**. The **rrr** correspond to the 3-bits of the ModR/M.reg field and the **bbb** correspond to the 3-bits of the ModR/M.r/m field.
- If the ModR/M.mod field is constrained to be a value other than 0b11, i.e., it must be one of 0b00, 0b01, or 0b10, then the notation **!(11)** is used.
- If the ModR/M.reg field had a specific required value, e.g., 0b101, that would be denoted as **mm:101:bbb**.

NOTE

Historically this document only specified the ModR/M.reg field restrictions with the notation /0 ... /7 and did not specify restrictions on the ModR/M.mod and ModR/M.r/m fields in the encoding boxes.

2.5 INTEL® AVX AND INTEL® SSE INSTRUCTION EXCEPTION CLASSIFICATION

To look up the exceptions of legacy 128-bit SIMD instruction, 128-bit VEX-encoded instructions, and 256-bit VEX-encoded instruction, Table summarizes the exception behavior into separate classes, with detailed exception conditions defined in sub-sections 2.5.1 through 2.6.1. For example, ADDPS contains the entry:

“See Exceptions Type 2.”

In this entry, “Type 2” can be looked up in Table 2-19.

The instruction’s corresponding CPUID feature flag can be identified in the fourth column of the Instruction summary table.

Note: #UD on CPUID feature flags=0 is not guaranteed in a virtualized environment if the hardware supports the feature flag.

NOTE

Instructions that operate only with MMX, X87, or general-purpose registers are not covered by the exception classes defined in this section. For instructions that operate on MMX registers, see Section 24.25.3, “Exception Conditions of Legacy SIMD Instructions Operating on MMX Registers” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3B.

Table 2-14. Exception Class Description

| Exception Class | Instruction Set | Mem Arg | Floating-Point Exceptions (#XM) |
|-----------------|---------------------|-----------------------------------|---------------------------------|
| Type 1 | AVX, Legacy SSE | 16/32 byte explicitly aligned | No |
| Type 2 | AVX, Legacy SSE | 16/32 byte not explicitly aligned | Yes |
| Type 3 | AVX, Legacy SSE | < 16 byte | Yes |
| Type 4 | AVX, Legacy SSE | 16/32 byte not explicitly aligned | No |
| Type 5 | AVX, Legacy SSE | < 16 byte | No |
| Type 6 | AVX (no Legacy SSE) | Varies | (At present, none do) |

Table 2-14. Exception Class Description (Contd.)

| Exception Class | Instruction Set | Mem Arg | Floating-Point Exceptions (#XM) |
|-----------------|--------------------|--|---------------------------------|
| Type 7 | AVX, Legacy SSE | None | No |
| Type 8 | AVX | None | No |
| Type 11 | F16C | 8 or 16 byte, Not explicitly aligned, no AC# | Yes |
| Type 12 | AVX2 Gathers | Not explicitly aligned, no AC# | No |

See Table 2-15 for lists of instructions in each exception class.

Table 2-15. Instructions in Each Exception Class

| Exception Class | Instruction |
|-----------------|--|
| Type 1 | (V)MOVAPD, (V)MOVAPS, (V)MOVDQA, (V)MOVNTDQ, (V)MOVNTDQA, (V)MOVNTPD, (V)MOVNTPS |

Table 2-15. Instructions in Each Exception Class (Contd.)

| Exception Class | Instruction |
|-----------------|---|
| Type 5 | (V)CVTDQ2PD, (V)EXTRACTPS, (V)INSERTPS, (V)MOVD, (V)MOVQ, (V)MOVDDUP, (V)MOVLPD, (V)MOVLPS, (V)MOVHPD, (V)MOVHPS, (V)MOVSD, (V)MOVSS, (V)PEXTRB, (V)PEXTRD, (V)PEXTRW, (V)PEXTRQ, (V)PINSRB, (V)PINSRD, (V)PINSRW, (V)PINSRQ, PMOVSBW, (V)RCPSS, (V)RSQRTSS, (V)PMOVSBX/ZX, VLDMXCSR*, VSTMXCSR |
| Type 6 | VEXTRACTF128/VEXTRACTFxxxx, VBROADCASTSS, VBROADCASTSD, VBROADCASTF128, VINSERTF128, VMASKMOVPS**, VMASKMOVDPD**, VPMASKMOVD, VPMASKMOVQ, VBROADCASTI128, VPBROADCASTB, VPBROADCASTD, VPBROADCASTW, VPBROADCASTQ, VEXTRACTI128, VINSERTI128, VPERM2I128 |
| Type 7 | (V)MOVLHPS, (V)MOVHLPS, (V)MOVMSKPD, (V)MOVMSKPS, (V)PMOVMSKB, (V)PSLLDQ, (V)PSRLDQ, (V)PSLLW, (V)PSLLD, (V)PSLLQ, (V)PSRAW, (V)PSRAD, (V)PSRLW, (V)PSRLD, (V)PSRLQ |
| Type 8 | VZEROALL, VZERoupper |
| Type 11 | VCVTPH2PS, VCVTPS2PH |
| Type 12 | VGATHERDPS, VGATHERDPD, VGATHERQPS, VGATHERQPD, VPGATHERDD, VPGATHERDQ, VPGATHERQD, VPGATHERQQ |

(*) - Additional exception restrictions are present - see the Instruction description for details

(**) - Instruction behavior on alignment check reporting with mask bits of less than all 1s are the same as with mask bits of all 1s, i.e., no alignment checks are performed.

(***) - PCMPSTRI, PCMPSTRM, PCMPISTRI, PCMPISTRM, and LDDQU instructions do not cause #GP if the memory operand is not aligned to 16-Byte boundary.

Table 2-15 classifies exception behaviors for Intel AVX instructions. Within each class of exception conditions that are listed in Table 2-18 through Table 2-27, certain subsets of Intel AVX instructions may be subject to #UD exception depending on the encoded value of the VEX.L field. Table 2-16 and Table 2-17 provide supplemental information of Intel AVX instructions that may be subject to #UD exception if encoded with incorrect values in the VEX.W or VEX.L field.

Table 2-16. #UD Exception and VEX.W=1 Encoding

2.5.1 Exceptions Type 1 (Aligned Memory Reference)

Table 2-18. Type 1 Class Exception Conditions

| Exception | Real | Virtual-8086 | Protected and Compatibility | 64-bit | Cause of Exception |
|----------------------------|------|--------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | | | VEX prefix. |
| | | | X | X | VEX prefix: If XCRO[2:1] ≠ '11b'. If CR4.OSXSAVE[bit 18]=0. |
| | X | X | X | X | Legacy SSE instruction: If CR0.EM[bit 2] = 1. If CR4.OSFXSR[bit 9] = 0. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a VEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | For an illegal address in the SS segment. |
| | | | | X | If a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | X | VEX.256: Memory operand is not 32-byte aligned. VEX.128: Memory operand is not 16-byte aligned. |
| | X | X | X | X | Legacy SSE: Memory operand is not 16-byte aligned. |
| | | | X | | For an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If the memory address is in a non-canonical form. |
| | X | X | | | If any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF(fault-code) | | X | X | X | For a page fault. |

2.5.2 Exceptions Type 2 (>=16 Byte Memory Reference, Unaligned)

Table 2-19. Type 2 Class Exception Conditions

| Exception | Real | Virtual 8086 | Protected and Compatibility | 64-bit | Cause of Exception |
|------------------------------------|------|--------------|-----------------------------|--------|---|
| Invalid Opcode, #UD | X | X | | | VEX prefix. |
| | X | X | X | X | If an unmasked SIMD floating-point exception and CR4.OSXMMEXCPT[bit 10] = 0. |
| | | | X | X | VEX prefix: If XCRO[2:1] ? '11b'. If CR4.OSXSAVE[bit 18]=0. |
| | X | X | X | X | Legacy SSE instruction: If CRO.EM[bit 2] = 1. If CR4.OSFXSR[bit 9] = 0. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a VEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | X | X | X | X | If CRO.TS[bit 3]=1. |

| | | | | X | If the memory address is in a non-canonical form. |
| | X | X | | | If any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF(fault-code) | | X | X | X | For a page fault. |
| Alignment Check #AC(0) | | X | X | X | For 2, 4, or 8 byte memory access if alignment checking is enabled and an unaligned memory access is made while the current privilege level is 3. |
| SIMD Floating-point Exception, #XM | X | X | X | X | If an unmasked SIMD floating-point exception and CR4.OSXMMEXCPT[bit 10] = 1. |

2.5.4 Exceptions Type 4 (>=16 Byte Mem Arg, No Alignment, No Floating-point Exceptions)

Table 2-21. Type 4 Class Exception Conditions

| Exception | Real | Virtual-8086 | Protected and Compatibility | 64-bit | Cause of Exception |
|----------------------------|------|--------------|-----------------------------|--------|---|
| Invalid Opcode, #UD | X | X | | | VEX prefix. |
| | | | X | X | VEX prefix: If XCRO[2:1] ? '11b'. If CR4.OSXSAVE[bit 18]=0. |
| | X | X | X | X | Legacy SSE instruction: If CRO.EM[bit 2] = 1. If CR4.OSFXSR[bit 9] = 0. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a VEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | X | X | X | X | If CRO.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | For an illegal address in the SS segment. |
| | | | | X | If a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | X | X | X | X | Legacy SSE: Memory operand is not 16-byte aligned. ¹ |
| | | | X | | For an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If the memory address is in a non-canonical form. |
| | X | X | | | If any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF(fault-code) | | X | X | X | For a page fault. |

NOTES:

1. LDDQU, MOVUPD, MOVUPS, PCMPSTRI, PCMPSTRM, PCMPISTRI, and PCMPISTRM instructions do not cause #GP if the memory operand is not aligned to 16-Byte boundary.

2.5.5 Exceptions Type 5 (<16 Byte Mem Arg and No FP Exceptions)

Table 2-22. Type 5 Class Exception Conditions

| Exception | Real | Virtual-8086 | Protected and Compatibility | 64-bit | Cause of Exception |
|----------------------------|------|--------------|-----------------------------|--------|---|
| Invalid Opcode, #UD | X | X | | | VEX prefix. |
| | | | X | X | VEX prefix: If XCRO[2:1] ? '11b'. If CR4.OSXSAVE[bit 18]=0. |
| | X | X | X | X | Legacy SSE instruction: If CRO.EM[bit 2] = 1. If CR4.OSFXSR[bit 9] = 0. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a VEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | X | X | X | X | If CRO.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | For an illegal address in the SS segment. |
| | | | | X | If a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | For an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If the memory address is in a non-canonical form. |
| | X | X | | | If any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF(fault-code) | | X | X | X | For a page fault. |
| Alignment Check #AC(0) | | X | X | X | For 2, 4, or 8 byte memory access if alignment checking is enabled and an unaligned memory access is made while the current privilege level is 3. |

2.5.6 Exceptions Type 6 (VEX-Encoded Instructions without Legacy SSE Analogues)

Note: At present, the AVX instructions in this category do not generate floating-point exceptions.

Table 2-23. Type 6 Class Exception Conditions

| Exception | Real | Virtual-8086 | Protected and Compatibility | 64-bit | Cause of Exception |
|---------------------------|------|--------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | | | VEX prefix. |
| | | | X | X | If XCRO[2:1] ? '11b'. If CR4.OSXSAVE[bit 18]=0. |
| | | | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a VEX prefix. |
| | | | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | | | X | X | If CRO.TS[bit 3]=1. |

| Exception | Real | Virtual-8086 | Protected and Compatibility | 64-bit | Cause of Exception |
|----------------------------|------|--------------|-----------------------------|--------|---|
| Stack, #SS(0) | | | X | | For an illegal address in the SS segment. |
| | | | | X | If a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | For an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If the memory address is in a non-canonical form. |
| Page Fault #PF(fault-code) | | | X | X | For a page fault. |
| Alignment Check #AC(0) | | | X | X | For 2, 4, or 8 byte memory access if alignment checking is enabled and an unaligned memory access is made while the current privilege level is 3. |

2.5.7 Exceptions Type 7 (No FP Exceptions, No Memory Arg)

Table 2-24. Type 7 Class Exception Conditions

| Exception | Real | Virtual-8086 | Protected and Compatibility | 64-bit | Cause of Exception |
|---------------------------|------|--------------|-----------------------------|--------|---|
| Invalid Opcode, #UD | X | X | | | VEX prefix. |
| | | | X | X | VEX prefix: If XCR0[2:1] ? '11b'. If CR4.OSXSAVE[bit 18]=0. |
| | X | X | X | X | Legacy SSE instruction: If CR0.EM[bit 2] = 1. If CR4.OSFXSR[bit 9] = 0. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a VEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | | | X | X | If CR0.TS[bit 3]=1. |

2.5.8 Exceptions Type 8 (AVX and No Memory Argument)

Table 2-25. Type 8 Class Exception Conditions

| Exception | Real | Virtual-8086 | Protected and Compatibility | 64-bit | Cause of Exception |
|---------------------------|------|--------------|-----------------------------|--------|---|
| Invalid Opcode, #UD | X | X | | | Always in Real or Virtual-8086 mode. |
| | | | X | X | If XCR0[2:1] ? '11b'. If CR4.OSXSAVE[bit 18]=0. If CPUID.01H.ECX.AVX[bit 28]=0. If VEX.vvvv ? 1111B. |
| | X | X | X | X | If proceeded by a LOCK prefix (F0H). |
| Device Not Available, #NM | | | X | X | If CR0.TS[bit 3]=1. |

2.5.9 Exceptions Type 11 (VEX-only, Mem Arg, No AC, Floating-point Exceptions)

Table 2-26. Type 11 Class Exception Conditions

| Exception | Real | Virtual-8086 | Protected and Compatibility | 64-bit | Cause of Exception |
|------------------------------------|------|--------------|-----------------------------|--------|---|
| Invalid Opcode, #UD | X | X | | | VEX prefix. |
| | | | X | X | VEX prefix: If XCRO[2:1] ? '11b'. If CR4.OSXSAVE[bit 18]=0. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a VEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | For an illegal address in the SS segment. |
| | | | | X | If a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | For an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If the memory address is in a non-canonical form. |
| | X | X | | | If any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF (fault-code) | | X | X | X | For a page fault. |
| SIMD Floating-Point Exception, #XM | X | X | X | X | If an unmasked SIMD floating-point exception and CR4.OSXMMEXCPT[bit 10] = 1. |

2.5.10 Exceptions Type 12 (VEX-only, VSIB Mem Arg, No AC, No Floating-point Exceptions)

Table 2-27. Type 12 Class Exception Conditions

| Exception | Real | Virtual-8086 | Protected and Compatibility | 64-bit | Cause of Exception |
|-----------------------------|------|--------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | | | VEX prefix. |
| | | | X | X | VEX prefix: If XCRO[2:1] ? '11b'. If CR4.OSXSAVE[bit 18]=0. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a VEX prefix. |
| | X | X | X | NA | If address size attribute is 16 bit. |
| | X | X | X | X | If ModR/M.mod = '11b'. |
| | X | X | X | X | If ModR/M.rm ? '100b'. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| | X | X | X | X | If any vector register is used more than once between the destination register, mask register and the index register in VSIB addressing. |
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | For an illegal address in the SS segment. |
| | | | | X | If a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | For an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If the memory address is in a non-canonical form. |
| | X | X | | | If any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF (fault-code) | | X | X | X | For a page fault. |

2.6 VEX ENCODING SUPPORT FOR GPR INSTRUCTIONS

The VEX prefix may be used to encode instructions that operate on neither YMM nor XMM registers. VEX-encoded general-purpose-register instructions have the following properties:

- Instruction syntax support for three encodable operands.
- Encoding support for instruction syntax of non-destructive source operand, destination operand encoded via VEX.vvvv, and destructive three-operand syntax.
- Elimination of escape opcode byte (0FH), two-byte escape via a compact bit field representation within the VEX prefix.
- Elimination of the need to use REX prefix to encode the extended half of general-purpose register sets (R8-R15) for direct register access or memory addressing.
- Flexible and more compact bit fields are provided in the VEX prefix to retain the full functionality provided by REX prefix. REX.W, REX.X, REX.B functionalities are provided in the three-byte VEX prefix only.
- VEX-encoded GPR instructions are encoded with VEX.L=0.

Any VEX-encoded GPR instruction with a 66H, F2H, or F3H prefix preceding VEX will #UD.

Any VEX-encoded GPR instruction with a REX prefix proceeding VEX will #UD.
 VEX-encoded GPR instructions are not supported in real and virtual 8086 modes.

2.6.1 Exceptions Type 13 (VEX-Encoded GPR Instructions)

The exception conditions applicable to VEX-encoded GPR instructions differ from those of legacy GPR instructions. Table 2-28 lists VEX-encoded GPR instructions. The exception conditions for VEX-encoded GPR instructions are found in Table 2-29 for those instructions which have a default operand size of 32 bits and 16-bit operand size is not encodable.

Table 2-28. VEX-Encoded GPR Instructions

| Exception Class | Instruction |
|-----------------|---|
| Type 13 | ANDN, BEXTR, BLSI, BLSMSK, BLSR, BZHI, MULX, PDEP, PEXT, RORX, SARX, SHLX, SHRX |

(*) - Additional exception restrictions are present - see the Instruction description for details.

Table 2-29. Type 13 Class Exception Conditions

| Exception | Real | Virtual-8086 | Protected and Compatibility | 64-bit | Cause of Exception |
|----------------------------|------|--------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | X | X | If BMI1/BMI2 CPUID feature flag is '0'. |
| | X | X | | | If a VEX prefix is present. |
| | X | X | X | X | If VEX.L = 1. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a VEX prefix. |
| Stack, #SS(0) | X | X | X | | For an illegal address in the SS segment. |
| | | | | X | If a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | For an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. If the DS, ES, FS, or GS register is used to access memory and it contains a null segment selector. |
| | | | | X | If the memory address is in a non-canonical form. |
| | X | X | | | If any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF(fault-code) | | X | X | X | For a page fault. |
| Alignment Check #AC(0) | | X | X | X | For 2, 4, or 8 byte memory access if alignment checking is enabled and an unaligned memory access is made while the current privilege level is 3. |

2.6.2 Exceptions Type 14 (CMPCCXADD)

The exception conditions applicable to the CMPCCXADD instruction differ from those of other VEX-encoded GPR instructions. The exception conditions for the CMPCCXADD instruction are found in Table 2-31.

Table 2-30. Exceptions Type 14 Instructions

| Exception Class | Instruction |
|-----------------|-------------|
| Type 14 | CMPCCXADD |

Table 2-31. Type 14 Class Exception Conditions

| Exception | Real | Virtual-8086 | Protected and Compatibility | 64-bit | Cause of Exception |
|-----------------------------|------|--------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | X | | Only supported in 64-bit mode. |
| | | | | X | If any LOCK, REX, F2, F3, or 66 prefixes precede a VEX prefix. |
| | | | | X | If any corresponding CPUID feature flag is '0'. |
| Stack, #SS(0) | | | | X | If a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | | X | If the memory address is in a non-canonical form. |
| Page Fault, #PF(fault-code) | | | | X | If a page fault occurs. |
| Alignment Check #AC(0) | | X | X | X | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |

2.7 INTEL® AVX-512 ENCODING

The majority of the Intel AVX-512 family of instructions (operating on 512/256/128-bit vector register operands) are encoded using a new prefix (called EVEX). Opmask instructions (operating on opmask register operands) are encoded using the VEX prefix. The EVEX prefix has some parts resembling the instruction encoding scheme using the VEX prefix, and many other capabilities not available with the VEX prefix.

The significant feature differences between EVEX and VEX are summarized below.

- EVEX is a 4-Byte prefix (the first byte must be 62H); VEX is either a 2-Byte (C5H is the first byte) or 3-Byte (C4H is the first byte) prefix.
- EVEX prefix can encode 32 vector registers (XMM/YMM/ZMM) in 64-bit mode.
- EVEX prefix can encode an opmask register for conditional processing or selection control in EVEX-encoded vector instructions. Opmask instructions, whose source/destination operands are opmask registers and treat the content of an opmask register as a single value, are encoded using the VEX prefix.
- EVEX memory addressing with disp8 form uses a compressed disp8 encoding scheme to improve the encoding density of the instruction byte stream.
- EVEX prefix can encode functionality that are specific to instruction classes (e.g., packed instruction with “load+op” semantic can support embedded broadcast functionality, floating-point instruction with rounding semantic can support static rounding functionality, floating-point instruction with non-rounding arithmetic semantic can support “suppress all exceptions” functionality).

2.7.1 Instruction Format and EVEX

The placement of the EVEX prefix in an IA instruction is represented in Figure 2-10. Note that the values contained within brackets are optional.

Figure 2-10. Intel® AVX-512 Instruction Format and the EVEX Prefix

The EVEX prefix is a 4-byte prefix, with the first two bytes derived from unused encoding form of the 32-bit-mode-only BOUND instruction. The layout of the EVEX prefix is shown in Figure 2-11. The first byte must be 62H, followed by three payload bytes, denoted as P0, P1, and P2 individually or collectively as P[23:0] (see Figure 2-11).

Figure 2-11. Bit Field Layout of the EVEX Prefix¹

NOTES:

1. See Table 2-32 for additional details on bit fields.

Table 2-32. EVEX Prefix Bit Field Functional Grouping

| Notation | Bit field Group | Position | Comment |
|-----------|---|----------|--|
| EVEX.mmm | Access to up to eight decoding maps | P[2:0] | Currently, only the following decoding maps are supported: 1, 2, 3, 5, and 6. |
| -- | Reserved | P[3] | Must be 0. |
| EVEX.R' | High-16 register specifier modifier | P[4] | Combine with EVEX.R and ModR/M.reg. This bit is stored in inverted format. |
| EVEX.RXB | Next-8 register specifier modifier | P[7:5] | Combine with ModR/M.reg, ModR/M.rm (base, index/vidx). This field is encoded in bit inverted format. |
| EVEX.X | High-16 register specifier modifier | P[6] | Combine with EVEX.B and ModR/M.rm, when SIB/VSIB absent. |
| EVEX.pp | Compressed legacy prefix | P[9:8] | Identical to VEX.pp. |
| -- | Fixed Value | P[10] | Must be 1. |
| EVEX.vvvv | VVVV register specifier | P[14:11] | Same as VEX.vvvv. This field is encoded in bit inverted format. |
| EVEX.W | Operand size promotion/Opcode extension | P[15] | |
| EVEX.aaa | Embedded opmask register specifier | P[18:16] | |
| EVEX.V' | High-16 VVVV/VIDX register specifier | P[19] | Combine with EVEX.vvvv or when VSIB present. This bit is stored in inverted format. |
| EVEX.b | Broadcast/RC/SAE Context | P[20] | |
| EVEX.L'L | Vector length/RC | P[22:21] | |
| EVEX.z | Zeroing/Merging | P[23] | |

The bit fields in P[23:0] are divided into the following functional groups (Table 2-32 provides a tabular summary):

- Reserved bits: P[3] must be 0, otherwise #UD.
- Fixed-value bit: P[10] must be 1, otherwise #UD.
- Compressed legacy prefix/escape bytes: P[1:0] is identical to the lowest 2 bits of VEX.mmmmm; P[9:8] is identical to VEX.pp.
- EVEX.mmm: P[2:0] provides access to up to eight decoding maps. Currently, only the following decoding maps are supported: 1, 2, 3, 5, and 6. Map ids 1, 2, and 3 are denoted by 0F, 0F38, and 0F3A, respectively, in the instruction encoding descriptions.
- Operand specifier modifier bits for vector register, general purpose register, memory addressing: P[7:5] allows access to the next set of 8 registers beyond the low 8 registers when combined with ModR/M register specifiers.
- Operand specifier modifier bit for vector register: P[4] (or EVEX.R') allows access to the high 16 vector register set when combined with P[7] and ModR/M.reg specifier; P[6] can also provide access to a high 16 vector register when SIB or VSIB addressing are not needed.
- Non-destructive source /vector index operand specifier: P[19] and P[14:11] encode the second source vector register operand in a non-destructive source syntax, vector index register operand can access an upper 16 vector register using P[19].
- Op-mask register specifiers: P[18:16] encodes op-mask register set k0-k7 in instructions operating on vector registers.
- EVEX.W: P[15] is similar to VEX.W which serves either as opcode extension bit or operand size promotion to 64-bit in 64-bit mode.
- Vector destination merging/zeroing: P[23] encodes the destination result behavior which either zeroes the masked elements or leave masked element unchanged.
- Broadcast/Static-rounding/SAE context bit: P[20] encodes multiple functionality, which differs across different classes of instructions and can affect the meaning of the remaining field (EVEX.L'L). The functionality for the following instruction classes are:

- Broadcasting a single element across the destination vector register: this applies to the instruction class with Load+Op semantic where one of the source operand is from memory.
- Redirect L'L field (P[22:21]) as static rounding control for floating-point instructions with rounding semantic. Static rounding control overrides MXCSR.RC field and implies "Suppress all exceptions" (SAE).
- Enable SAE for floating -point instructions with arithmetic semantic that is not rounding.
- For instruction classes outside of the afore-mentioned three classes, setting EVEX.b will cause #UD.
- Vector length/rounding control specifier: P[22:21] can serve one of three options.
 - Vector length information for packed vector instructions.
 - Ignored for instructions operating on vector register content as a single data element.
 - Rounding control for floating-point instructions that have a rounding semantic and whose source and destination operands are all vector registers.

2.7.2 Register Specifier Encoding and EVEX

EVEX-encoded instruction can access 8 opmask registers, 16 general-purpose registers and 32 vector registers in 64-bit mode (8 general-purpose registers and 8 vector registers in non-64-bit modes). EVEX-encoding can support instruction syntax that access up to 4 instruction operands. Normal memory addressing modes and VSIB memory addressing are supported with EVEX prefix encoding. The mapping of register operands used by various instruction syntax and memory addressing in 64-bit mode are shown in Table 2-33. Opmask register encoding is described in Section 2.7.3.

Table 2-33. 32-Register Support in 64-bit Mode Using EVEX with Embedded REX Bits

| | 4 ¹ | 3 | [2:0] | Reg. Type | Common Usages |
|--------------|----------------|-----------|-----------|-------------|---------------------------|
| REG | EVEX.R' | REX.R | modrm.reg | GPR, Vector | Destination or Source |
| VVVV | EVEX.V' | EVEX.vvvv | | GPR, Vector | 2ndSource or Destination |
| RM | EVEX.X | EVEX.B | modrm.r/m | GPR, Vector | 1st Source or Destination |
| BASE | 0 | EVEX.B | modrm.r/m | GPR | memory addressing |
| INDEX | 0 | EVEX.X | sib.index | GPR | memory addressing |
| VIDX | EVEX.V' | EVEX.X | sib.index | Vector | VSIB memory addressing |

NOTES:

1. Not applicable for accessing general purpose registers.

The mapping of register operands used by various instruction syntax and memory addressing in 32-bit modes are shown in Table 2-34.

Table 2-34. EVEX Encoding Register Specifiers in 32-bit Mode

| | [2:0] | Reg. Type | Common Usages |
|--------------|-----------|-------------|---------------------------|
| REG | modrm.reg | GPR, Vector | Destination or Source |
| VVVV | EVEX.vvv | GPR, Vector | 2nd Source or Destination |
| RM | modrm.r/m | GPR, Vector | 1st Source or Destination |
| BASE | modrm.r/m | GPR | Memory Addressing |
| INDEX | sib.index | GPR | Memory Addressing |
| VIDX | sib.index | Vector | VSIB Memory Addressing |

2.7.3 Opmask Register Encoding

There are eight opmask registers, k0-k7. Opmask register encoding falls into two categories:

- Opmask registers that are the source or destination operands of an instruction treating the content of opmask register as a scalar value, are encoded using the VEX prefix scheme. It can support up to three operands using standard modR/M byte's reg field and rm field and VEX.vvvv. Such a scalar opmask instruction does not support conditional update of the destination operand.
- An opmask register providing conditional processing and/or conditional update of the destination register of a vector instruction is encoded using EVEX.aaa field (see Section 2.7.4).
- An opmask register serving as the destination or source operand of a vector instruction is encoded using standard modR/M byte's reg field and rm fields.

Table 2-35. Opmask Register Specifier Encoding

| | [2:0] | Register Access | Common Usages |
|------|-----------|---------------------|---------------|
| REG | modrm.reg | k0-k7 | Source |
| VVVV | VEX.vvvv | k0-k7 | 2nd Source |
| RM | modrm.r/m | k0-7 | 1st Source |
| {k1} | EVEX.aaa | k0 ¹ -k7 | Opmask |

NOTES:

1. Instructions that overwrite the conditional mask in opmask do not permit using k0 as the embedded mask.

2.7.4 Masking Support in EVEX

EVEX can encode an opmask register to conditionally control per-element computational operation and updating of result of an instruction to the destination operand. The predicate operand is known as the opmask register. The EVEX.aaa field, P[18:16] of the EVEX prefix, is used to encode one out of a set of eight 64-bit architectural registers. Note that from this set of 8 architectural registers, only k1 through k7 can be addressed as predicate operands. k0 can be used as a regular source or destination but cannot be encoded as a predicate operand.

AVX-512 instructions support two types of masking with EVEX.z bit (P[23]) controlling the type of masking:

- Merging-masking, which is the default type of masking for EVEX-encoded vector instructions, preserves the old value of each element of the destination where the corresponding mask bit has a 0. It corresponds to the case of EVEX.z = 0.
- Zeroing-masking, is enabled by having the EVEX.z bit set to 1. In this case, an element of the destination is set to 0 when the corresponding mask bit has a 0 value.

AVX-512 Foundation instructions can be divided into the following groups:

- Instructions which support “zeroing-masking”.
 - Also allow merging-masking.
- Instructions which require aaa = 000.
 - Do not allow any form of masking.
- Instructions which allow merging-masking but do not allow zeroing-masking.
 - Require EVEX.z to be set to 0.
 - This group is mostly composed of instructions that write to memory.
- Instructions which require aaa <> 000 do not allow EVEX.z to be set to 1.
 - Allow merging-masking and do not allow zeroing-masking, e.g., gather instructions.

2.7.5 Compressed Displacement (disp8*N) Support in EVEX

For memory addressing using disp8 form, EVEX-encoded instructions always use a compressed displacement scheme by multiplying disp8 in conjunction with a scaling factor N that is determined based on the vector length, the value of EVEX.b bit (embedded broadcast) and the input element size of the instruction. In general, the factor N corresponds to the number of bytes characterizing the internal memory operation of the input operand (e.g., 64 when the accessing a full 512-bit memory vector). The scale factor N is listed in Table 2-36 and Table 2-37 below, where EVEX encoded instructions are classified using the **tupletype** attribute. The scale factor N of each tupletype is listed based on the vector length (VL) and other factors affecting it.

Table 2-36 covers EVEX-encoded instructions which has a load semantic in conjunction with additional computational or data element movement operation, operating either on the full vector or half vector (due to conversion of numerical precision from a wider format to narrower format). EVEX.b is supported for such instructions for data element sizes which are either dword or qword (see Section 2.7.11).

EVEX-encoded instruction that are pure load/store, and “Load+op” instruction semantic that operate on data element size less than dword do not support broadcasting using EVEX.b. These are listed in Table 2-37. Table 2-37 also includes many broadcast instructions which perform broadcast using a subset of data elements without using EVEX.b. These instructions and a few data element size conversion instruction are covered in Table 2-37. Instruction classified in Table 2-37 do not use EVEX.b and EVEX.b must be 0, otherwise #UD will occur.

The tupletype will be referenced in the instruction operand encoding table in the reference page of each instruction, providing the cross reference for the scaling factor N to encoding memory addressing operand.

Note that the disp8*N rules still apply when using 16b addressing.

Table 2-36. Compressed Displacement (DISP8*N) Affected by Embedded Broadcast

| TupleType | EVEX.b | InputSize | EVEX.W | Broadcast | N (VL=128) | N (VL=256) | N (VL= 512) | Comment |
|-----------|--------|-----------|--------|-----------|------------|------------|-------------|-----------------------------------|
| Full | 0 | 32bit | 0 | none | 16 | 32 | 64 | Load+Op (Full Vector Dword/Qword) |
| | 1 | 32bit | 0 | {1tox} | 4 | 4 | 4 | |
| | 0 | 64bit | 1 | none | 16 | 32 | 64 | |
| | 1 | 64bit | 1 | {1tox} | 8 | 8 | 8 | |
| Half | 0 | 32bit | 0 | none | 8 | 16 | 32 | Load+Op (Half Vector) |
| | 1 | 32bit | 0 | {1tox} | 4 | 4 | 4 | |

Table 2-37. EVEX DISP8*N for Instructions Not Affected by Embedded Broadcast

| TupleType | InputSize | EVEX.W | N (VL= 128) | N (VL= 256) | N (VL= 512) | Comment |
|---------------|-----------|--------|-------------|-------------|-------------|---|
| Full Mem | N/A | N/A | 16 | 32 | 64 | Load/store or subDword full vector |
| Tuple1 Scalar | 8bit | N/A | 1 | 1 | 1 | 1 Tuple |
| | 16bit | N/A | 2 | 2 | 2 | |
| | 32bit | 0 | 4 | 4 | 4 | |
| | 64bit | 1 | 8 | 8 | 8 | |
| Tuple1 Fixed | 32bit | N/A | 4 | 4 | 4 | 1 Tuple, memsize not affected by EVEX.W |
| | 64bit | N/A | 8 | 8 | 8 | |
| Tuple2 | 32bit | 0 | 8 | 8 | 8 | Broadcast (2 elements) |
| | 64bit | 1 | NA | 16 | 16 | |
| Tuple4 | 32bit | 0 | NA | 16 | 16 | Broadcast (4 elements) |
| | 64bit | 1 | NA | NA | 32 | |
| Tuple8 | 32bit | 0 | NA | NA | 32 | Broadcast (8 elements) |
| Half Mem | N/A | N/A | 8 | 16 | 32 | SubQword Conversion |
| Quarter Mem | N/A | N/A | 4 | 8 | 16 | SubDword Conversion |

Table 2-37. EVEX DISP8*N for Instructions Not Affected by Embedded Broadcast (Contd.)

| TupleType | InputSize | EVEX.W | N (VL= 128) | N (VL= 256) | N (VL= 512) | Comment |
|-------------------|-----------|--------|-------------|-------------|-------------|-------------------------|
| Eighth Mem | N/A | N/A | 2 | 4 | 8 | SubWord Conversion |
| Mem128 | N/A | N/A | 16 | 16 | 16 | Shift count from memory |
| MOVDDUP | N/A | N/A | 8 | 32 | 64 | VMOVDDUP |

2.7.6 EVEX Encoding of Broadcast/Rounding/SAE Support

EVEX.b can provide three types of encoding context, depending on the instruction classes:

- Embedded broadcasting of one data element from a source memory operand to the destination for vector instructions with “load+op” semantic.
- Static rounding control overriding MXCSR.RC for floating-point instructions with rounding semantic.
- “Suppress All exceptions” (SAE) overriding MXCSR mask control for floating-point arithmetic instructions that do not have rounding semantic.

2.7.7 Embedded Broadcast Support in EVEX

EVEX encodes an embedded broadcast functionality that is supported on many vector instructions with 32-bit (double word or single precision floating-point) and 64-bit data elements, and when the source operand is from memory. EVEX.b (P[20]) bit is used to enable broadcast on load-op instructions. When enabled, only one element is loaded from memory and broadcasted to all other elements instead of loading the full memory size.

The following instruction classes do not support embedded broadcasting:

- Instructions with only one scalar result is written to the vector destination.
- Instructions with explicit broadcast functionality provided by its opcode.
- Instruction semantic is a pure load or a pure store operation.

2.7.8 Static Rounding Support in EVEX

Static rounding control embedded in the EVEX encoding system applies only to register-to-register flavor of floating-point instructions with rounding semantic at two distinct vector lengths: (i) scalar, (ii) 512-bit. In both cases, the field EVEX.L'L expresses rounding mode control overriding MXCSR.RC if EVEX.b is set. When EVEX.b is set, “suppress all exceptions” is implied. The processor behaves as if all MXCSR masking controls are set.

2.7.9 SAE Support in EVEX

The EVEX encoding system allows arithmetic floating-point instructions without rounding semantic to be encoded with the SAE attribute. This capability applies to scalar and 512-bit vector lengths, register-to-register only, by setting EVEX.b. When EVEX.b is set, “suppress all exceptions” is implied. The processor behaves as if all MXCSR masking controls are set.

2.7.10 Vector Length Orthogonality

The architecture of EVEX encoding scheme can support SIMD instructions operating at multiple vector lengths. Many AVX-512 Foundation instructions operate at 512-bit vector length. The vector length of EVEX encoded vector instructions are generally determined using the L'L field in EVEX prefix, except for 512-bit floating-point, reg-reg instructions with rounding semantic. The table below shows the vector length corresponding to various values of the L'L bits. When EVEX is used to encode scalar instructions, L'L is generally ignored.

When EVEX.b bit is set for a register-register instructions with floating-point rounding semantic, the same two bits P2[6:5] specifies rounding mode for the instruction, with implied SAE behavior. The mapping of different instruction classes relative to the embedded broadcast/rounding/SAE control and the EVEX.L'L fields are summarized in Table 2-38.

Table 2-38. EVEX Embedded Broadcast/Rounding/SAE and Vector Length on Vector Instructions

| Position | P2[4] | P2[6:5] | P2[6:5] |
|---|--|---|---|
| Broadcast/Rounding/SAE Context | EVEX.b | EVEX.L'L | EVEX.RC |
| Reg-reg, FP Instructions w/ rounding semantic or SAE | Enable static rounding control (SAE implied) | Vector length Implied (512 bit or scalar) | 00b: SAE + RNE 01b: SAE + RD 10b: SAE + RU 11b: SAE + RZ |
| Load+op Instructions w/ memory source | Broadcast Control | 00b: 128-bit 01b: 256-bit 10b: 512-bit 11b: Reserved (#UD) | NA |
| Other Instructions (Explicit Load/Store/Broadcast/Gather/Scatter) | Must be 0 (otherwise #UD) | | NA |

2.7.11 #UD Equations for EVEX

Instructions encoded using EVEX can face three types of UD conditions: state dependent, opcode independent and opcode dependent.

2.7.11.1 State Dependent #UD

In general, attempts to execute an instruction, which required OS support for incremental extended state component, will #UD if required state components were not enabled by OS. Table 2-39 lists instruction categories with respect to required processor state components. Attempts to execute a given category of instructions while enabled states were less than the required bit vector in XCR0 shown in Table 2-39 will cause #UD.

Table 2-39. OS XSAVE Enabling Requirements of Instruction Categories

| Instruction Categories | Vector Register State Access | Required XCR0 Bit Vector [7:0] |
|---|------------------------------|--------------------------------|
| Legacy SIMD prefix encoded Instructions (e.g SSE) | XMM | xxxxxx11b |
| VEX-encoded instructions operating on YMM | YMM | xxxxx111b |
| EVEX-encoded 128-bit instructions | ZMM | 111xx111b |
| EVEX-encoded 256-bit instructions | ZMM | 111xx111b |
| EVEX-encoded 512-bit instructions | ZMM | 111xx111b |
| VEX-encoded instructions operating on opmask | k-reg | 111xxx11b |

2.7.11.2 Opcode Independent #UD

A number of bit fields in EVEX encoded instruction must obey mode-specific but opcode-independent patterns listed in Table 2-40.

Table 2-40. Opcode Independent, State Dependent EVEX Bit Fields¹

| Position | Notation | 64-bit #UD | Non-64-bit #UD |
|----------|----------|------------------------|--------------------------------|
| P[3] | -- | if > 0 | if > 0 |
| P[10] | -- | if 0 | if 0 |
| P[2:0] | EVEX.mmm | if 000b, 100b, or 111b | if 000b, 100b, or 111b |
| P[7 : 6] | EVEX.RX | None (valid) | None (BOUND if EVEX.RX != 11b) |

NOTES:

1. This table is also representative of VEX restrictions. For VEX operations, use the Notation field.

2.7.11.3 Opcode Dependent #UD

This section describes legal values for the rest of the EVEX bit fields. Table 2-41 lists the #UD conditions of EVEX prefix bit fields which encodes or modifies register operands.

Table 2-41. #UD Conditions of Operand-Encoding EVEX Prefix Bit Fields¹

| Notation | Position | Operand Encoding | 64-bit #UD | Non-64-bit #UD |
|-----------|----------|---------------------------------------|----------------|--------------------------------|
| EVEX.R | P[7] | ModRM.reg encodes k-reg | If EVEX.R = 0 | None (BOUND if EVEX.RX != 11b) |
| | | ModRM.reg is opcode extension | None (ignored) | |
| | | ModRM.reg encodes all other registers | None (valid) | |
| EVEX.X | P[6] | ModRM.r/m encodes ZMM/YMM/XMM | None (valid) | |
| | | ModRM.r/m encodes k-reg or GPR | None (ignored) | |
| | | ModRM.r/m without SIB/VSIB | None (ignored) | |
| | | ModRM.r/m with SIB/VSIB | None (valid) | |
| EVEX.B | P[5] | ModRM.r/m encodes k-reg | None (ignored) | None (ignored) |
| | | ModRM.r/m encodes other registers | None (valid) | |
| | | ModRM.r/m base present | None (valid) | |
| | | ModRM.r/m base not present | None (ignored) | |
| EVEX.R' | P[4] | ModRM.reg encodes k-reg or GPR | If 0 | None (ignored) |
| | | ModRM.reg is opcode extension | None (ignored) | |
| | | ModRM.reg encodes ZMM/YMM/XMM | None (valid) | |
| EVEX.vvvv | P[14:11] | vvvv encodes ZMM/YMM/XMM | None (valid) | None (valid) P[14] ignored |
| | | Otherwise | If != 1111b | If != 1111b |
| EVEX.V' | P[19] | Encodes ZMM/YMM/XMM | None (valid) | If 0 |
| | | Otherwise | If 0 | If 0 |

NOTES:

1. This table also represents VEX restrictions.

Table 2-42 lists the #UD conditions of instruction encoding of opmask register using EVEX.aaa and EVEX.z

Table 2-42. #UD Conditions of Opmask Related Encoding Field

| Notation | Position | Operand Encoding | 64-bit #UD | Non-64-bit #UD |
|-----------|----------|---|----------------------------|----------------------------|
| EVEX.aaa | P[18:16] | Instructions do not use opmask for conditional processing ¹ . | If aaa != 000b | If aaa != 000b |
| | | Opmask used as conditional processing mask and updated at completion ² . | If aaa = 000b | If aaa = 000b; |
| | | Opmask used as conditional processing. | None (valid ³) | None (valid ¹) |
| EVEX.z | P[23] | Vector instruction using opmask as source or destination ⁴ . | If EVEX.z != 0 | If EVEX.z != 0 |
| | | Store instructions or gather/scatter instructions. | If EVEX.z != 0 | If EVEX.z != 0 |
| | | Instructions with EVEX.aaa = 000b. | If EVEX.z != 0 | If EVEX.z != 0 |
| VEEX.vvvv | Varies | K-regs are instruction operands not mask control. | If vvvv = 0xxxb | None |

NOTES:

1. E.g., VPBROADCASTMxxx, VPMOVM2x, VPMOVx2M.

2. E.g., Gather/Scatter family.

3. aaa can take any value. A value of 000 indicates that there is no masking on the instruction; in this case, all elements will be processed as if there was a mask of 'all ones' regardless of the actual value in KO.
4. E.g., VFPClassSPD/PS, VCMPB/D/Q/W family, VPMOVM2x, VPMOVx2M.

Table 2-43 lists the #UD conditions of EVEX bit fields that depends on the context of EVEX.b.

Table 2-43. #UD Conditions Dependent on EVEX.b Context

| Notation | Position | Operand Encoding | 64-bit #UD | Non-64-bit #UD |
|-----------|------------|---|----------------------------|----------------------------|
| EVEX.L'Lb | P[22 : 20] | Reg-reg, FP instructions with rounding semantic. | None (valid ¹) | None (valid ¹) |
| | | Other reg-reg, FP instructions that can cause #XM. | None (valid ²) | None (valid ²) |
| | | Other reg-mem instructions in Table 2-36. | None (valid ³) | None (valid ³) |
| | | Other instruction classes ⁴ in Table 2-37. | If EVEX.b = 1 | If EVEX.b = 1 |

NOTES:

1. L'L specifies rounding control, see Table 2-38, supports {er} syntax.
2. L'L is ignored.
3. L'L specifies vector length, see Table 2-38, supports embedded broadcast syntax
4. L'L specifies either vector length or ignored.

2.7.12 Device Not Available

EVEX-encoded instructions follow the same rules when it comes to generating #NM (Device Not Available) exception. In particular, it is generated when CR0.TS[bit 3] = 1.

2.7.13 Scalar Instructions

EVEX-encoded scalar SIMD instructions can access up to 32 registers in 64-bit mode. Scalar instructions support masking (using the least significant bit of the opmask register), but broadcasting is not supported.

2.8 EXCEPTION CLASSIFICATIONS OF EVEX-ENCODED INSTRUCTIONS

The exception behavior of EVEX-encoded instructions can be classified into the classes shown in the rest of this section. The classification of EVEX-encoded instructions follow a similar framework as those of AVX and AVX2 instructions using the VEX prefix. Exception types for EVEX-encoded instructions are named in the style of "E##" or with a suffix "E##XX". The "##" designation generally follows that of AVX/AVX2 instructions. The majority of EVEX encoded instruction with "Load+op" semantic supports memory fault suppression, which is represented by E##. The instructions with "Load+op" semantic but do not support fault suppression are named "E##NF". A summary table of exception classes by class names are shown below.

Table 2-44. EVEX-Encoded Instruction Exception Class Summary

| Exception Class | Instruction set | Mem arg | (#XM) |
|-----------------|------------------------------------|--|-------|
| Type E1 | Vector Moves/Load/Stores | Explicitly aligned, w/ fault suppression | None |
| Type E1NF | Vector Non-temporal Stores | Explicitly aligned, no fault suppression | None |
| Type E2 | FP Vector Load+op | Support fault suppression | Yes |
| Type E2NF | FP Vector Load+op | No fault suppression | Yes |
| Type E3 | FP Scalar/Partial Vector, Load+Op | Support fault suppression | Yes |
| Type E3NF | FP Scalar/Partial Vector, Load+Op | No fault suppression | Yes |
| Type E4 | Integer Vector Load+op | Support fault suppression | No |
| Type E4NF | Integer Vector Load+op | No fault suppression | No |
| Type E5 | Legacy-like Promotion | Varies, Support fault suppression | No |
| Type E5NF | Legacy-like Promotion | Varies, No fault suppression | No |
| Type E6 | Post AVX Promotion | Varies, w/ fault suppression | No |
| Type E6NF | Post AVX Promotion | Varies, no fault suppression | No |
| Type E7NM | Register-to-register op | None | None |
| Type E9NF | Miscellaneous 128-bit | Vector-length Specific, no fault suppression | None |
| Type E10 | Non-XF Scalar | Vector Length ignored, w/ fault suppression | None |
| Type E10NF | Non-XF Scalar | Vector Length ignored, no fault suppression | None |
| Type E11 | VCVTPH2PS, VCVTPS2PH | Half Vector Length, w/ fault suppression | Yes |
| Type E12 | Gather and Scatter Family | VSIB addressing, w/ fault suppression | None |
| Type E12NP | Gather and Scatter Prefetch Family | VSIB addressing, w/o page fault | None |

Table 2-45 lists EVEX-encoded instruction mnemonic by exception classes.

Table 2-45. EVEX Instructions in Each Exception Class

| Exception Class | Instruction |
|-----------------|--|
| Type E1 | VMOVAPD, VMOVAPS, VMOVDQA32, VMOVDQA64 |
| Type E1NF | VMOVNTDQ, VMOVNTDQA, VMOVNTPD, VMOVNTPS |
| Type E2 | VADDPD, VADDPH, VADDPS, VCMPPD, VCMPPH, VCMPPS, VCVTDQ2PH, VCVTDQ2PS, VCVTPD2DQ, VCVTPD2PH, VCVTPD2PS, VCVTPD2QQ, VCVTPD2UQQ, VCVTPD2UDQ, VCVTPH2DQ, VCVTPH2PD, VCVTPH2QQ, VCVTPH2UDQ, VCVTPH2UQQ, VCVTPH2UW, VCVTPH2W, VCVTPS2DQ, VCVTPS2PD, VCVTPS2QQ, VCVTPS2UDQS, VCVTPS2UQQ, VCVTQQ2PD, VCVTQQ2PH, VCVTQQ2PS, VCVTTPD2DQ, VCVTTPD2QQ, VCVTTPD2UDQ, VCVTTPD2UQQ, VCVTTPH2DQ, VCVTTPH2QQ, VCVTTPH2UDQ, VCVTTPH2UQQ, VCVTTPH2UW, VCVTTPH2W, VCVTTPS2DQ, VCVTTPS2QQ, VCVTTPS2UDQ, VCVTTPS2UQQ, VCVTUDQ2PH, VCVTUDQ2PS, VCVTUQQ2PD, VCVTUQQ2PH, VCVTUQQ2PS, VCVTUW2PH, VCVTW2PH, VDIVPD, VDIVPH, VDIVPS, VEXP2PD, VEXP2PS, VFIXUPIMMPD, VFIXUPIMMPS, VFMADDxxxPD, VFMADDxxxPH, VFMADDxxxPS, VFMADDSUBxxxPD, VFMADDSUBxxxPH, VFMADDSUBxxxPS, VFMSUBADDxxxPD, VFMSUBADDxxxPH, VFMSUBADDxxxPS, VFMSUBxxxPD, VFMSUBxxxPH, VFMSUBxxxPS, VFNMADDxxxPD, VFNMADDxxxPH, VFNMADDxxxPS, VFNMSUBxxxPD, VFNMSUBxxxPH, VFNMSUBxxxPS, VGETEXPPD, VGETEXPPH, VGETEXPPS, VGETMANTPD, VGETMANTPH, VGETMANTPS, VGETMANTSH, VMAXPD, VMAXPH, VMAXPS, VMINPD, VMINPH, VMINPS, VMULPD, VMULPH, VMULPS, VRANGEPPD, VRANGEPS, VREDUCEPD, VREDUCEPH, VREDUCEPS, VRNDSCALEPD, VRNDSCALEPH, VRNDSCALEPS, VRCP28PD, VRCP28PS, VRSQRT28PD, VRSQRT28PS, VSCALEFPD, VSCALEFPS, VSQRTPD, VSQRTPH, VSQRTPS, VSUBPD, VSUBPH, VSUBPS |

Table 2-45. EVEX Instructions in Each Exception Class (Contd.)

| Exception Class | Instruction |
|----------------------|--|
| Type E3 | VADDS, VADDSH, VADDS, VCMPSD, VCMPSH, VCMPS, VCVTSD2SH, VCVTSD2SS, VCVTSH2SD, VCVTSH2SS, VCVTSS2SD, VCVTSS2SH, VDIVSD, VDIVSH, VDIVS, VFMADDxxxSD, VFMADDxxxSH, VFMADDxxxSS, VFMSUBxxxSD, VFMSUBxxxSH, VFMSUBxxxSS, VFNMADDxxxSD, VFNMADDxxxSH, VFNMADDxxxSS, VFNMSUBxxxSD, VFNMSUBxxxSH, VFNMSUBxxxSS, VFIXUPIMMSD, VFIXUPIMMSS, VGETEXPSD, VGETEXPSS, VGETEXPSS, VGETMANTSD, VGETMANTSH, VGETMANTSS, VMAXSD, VMAXSH, VMAXSS, VMINSD, VMINSH, VMINSS, VMULSD, VMULSH, VMULSS, VRANGESD, VRANGESS, VREDUCESD, VREDUCESH, VREDUCES, VRNDSCALESD, VRNDSCALESH, VRNDSCALESS, VSCALEFSD, VSCALEFSH, VSCALEFSS, VRC28SD, VRC28SS, VRSQRT28SD, VRSQRT28SS, VSQRTSD, VSQRTSH, VSQRTSS, VSUBSD, VSUBSH, VSUBSS |

NOTES:

1. Operand encoding Full tupletype with immediate.
2. Embedded broadcast is not supported with the “.nb” suffix.
3. Operand encoding Mem128 tupletype.
4. #UD raised if EVEX.L'L != 00b (VL=128).
5. The source operand is a general purpose register.
6. W0 encoding only.

2.8.1 Exceptions Type E1 and E1NF of EVEX-Encoded Instructions

EVEX-encoded instructions with memory alignment restrictions, and supporting memory fault suppression follow exception class E1.

Table 2-46. Type E1 Class Exception Conditions

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|----------------------------|------|---------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | | | If EVEX prefix present. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: <ul style="list-style-type: none"> State requirement, Table 2-39 not met. Opcode independent #UD condition in Table 2-40. Operand encoding #UD conditions in Table 2-41. Opmask encoding #UD condition of Table 2-42. EVEX.b encoding #UD condition of Table 2-43. Instruction specific EVEX.L'L restriction not met. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a EVEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | If fault suppression not set, and an illegal address in the SS segment. |
| | | | | X | If fault suppression not set, and a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | X | EVEX.512: Memory operand is not 64-byte aligned. EVEX.256: Memory operand is not 32-byte aligned. EVEX.128: Memory operand is not 16-byte aligned. |
| | | | X | | If fault suppression not set, and an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If fault suppression not set, and the memory address is in a non-canonical form. |
| | X | X | | | If fault suppression not set, and any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF(fault-code) | | X | X | X | If fault suppression not set, and a page fault. |

EVEX-encoded instructions with memory alignment restrictions, but do not support memory fault suppression follow exception class E1NF.

Table 2-47. Type E1NF Class Exception Conditions

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|----------------------------|------|---------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | | | If EVEX prefix present. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: <ul style="list-style-type: none"> State requirement, Table 2-39 not met. Opcode independent #UD condition in Table 2-40. Operand encoding #UD conditions in Table 2-41. Opmask encoding #UD condition of Table 2-42. EVEX.b encoding #UD condition of Table 2-43. Instruction specific EVEX.L'L restriction not met. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a EVEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | For an illegal address in the SS segment. |
| | | | | X | If a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | X | EVEX.512: Memory operand is not 64-byte aligned. EVEX.256: Memory operand is not 32-byte aligned. EVEX.128: Memory operand is not 16-byte aligned. |
| | | | X | | For an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If the memory address is in a non-canonical form. |
| | X | X | | | If any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF(fault-code) | | X | X | X | For a page fault. |

2.8.2 Exceptions Type E2 of EVEX-Encoded Instructions

EVEX-encoded vector instructions with arithmetic semantic follow exception class E2.

Table 2-48. Type E2 Class Exception Conditions

| Exception | Real | Virtual 8086 | Protected and Compatibility | 64-bit | Cause of Exception |
|------------------------------------|------|--------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | | | If EVEX prefix present. |
| | X | X | X | X | If an unmasked SIMD floating-point exception and CR4.OSXMMEXCPT[bit 10] = 0. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: <ul style="list-style-type: none"> State requirement, Table 2-39 not met. Opcode independent #UD condition in Table 2-40. Operand encoding #UD conditions in Table 2-41. Opmask encoding #UD condition of Table 2-42. Instruction specific EVEX.L'L restriction not met. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a EVEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | If fault suppression not set, and an illegal address in the SS segment. |
| | | | | X | If fault suppression not set, and a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | If fault suppression not set, and an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If fault suppression not set, and the memory address is in a non-canonical form. |
| | X | X | | | If fault suppression not set, and any part of the operand lies outside the effective address space from 0 to FFFFFH. |
| Page Fault #PF(fault-code) | | X | X | X | If fault suppression not set, and a page fault. |
| Alignment Check #AC(0) | | X | X | X | For 2, 4, or 8 byte memory access if alignment checking is enabled and an unaligned memory access is made while the current privilege level is 3. |
| SIMD Floating-point Exception, #XM | X | X | X | X | If an unmasked SIMD floating-point exception, {sae} or {er} not set, and CR4.OSXMMEXCPT[bit 10] = 1. |

2.8.3 Exceptions Type E3 and E3NF of EVEX-Encoded Instructions

EVEX-encoded scalar instructions with arithmetic semantic that support memory fault suppression follow exception class E3.

Table 2-49. Type E3 Class Exception Conditions

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|------------------------------------|------|---------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | | | If EVEX prefix present. |
| | X | X | X | X | If an unmasked SIMD floating-point exception and CR4.OSXMMEXCPT[bit 10] = 0. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: <ul style="list-style-type: none"> State requirement, Table 2-39 not met. Opcode independent #UD condition in Table 2-40. Operand encoding #UD conditions in Table 2-41. Opmask encoding #UD condition of Table 2-42. EVEX.b encoding #UD condition of Table 2-43. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a EVEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | If fault suppression not set, and an illegal address in the SS segment. |
| | | | | X | If fault suppression not set, and a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | If fault suppression not set, and an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If fault suppression not set, and the memory address is in a non-canonical form. |
| | X | X | | | If fault suppression not set, and any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF(fault-code) | | X | X | X | If fault suppression not set, and a page fault. |
| Alignment Check #AC(0) | | X | X | X | For 2, 4, or 8 byte memory access if alignment checking is enabled and an unaligned memory access is made while the current privilege level is 3. |
| SIMD Floating-point Exception, #XM | X | X | X | X | If an unmasked SIMD floating-point exception, {sae} or {er} not set, and CR4.OSXMMEXCPT[bit 10] = 1. |

EVEX-encoded scalar instructions with arithmetic semantic that do not support memory fault suppression follow exception class E3NF.

Table 2-50. Type E3NF Class Exception Conditions

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|------------------------------------|------|---------------|-----------------------------|--------|---|
| Invalid Opcode, #UD | X | X | | | EVEX prefix. |
| | X | X | X | X | If an unmasked SIMD floating-point exception and CR4.OSXMMEXCPT[bit 10] = 0. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: ▪ State requirement, Table 2-39 not met. ▪ Opcode independent #UD condition in Table 2-40. ▪ Operand encoding #UD conditions in Table 2-41. ▪ Opmask encoding #UD condition of Table 2-42. ▪ EVEX.b encoding #UD condition of Table 2-43. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a EVEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | For an illegal address in the SS segment. |
| | | | | X | If a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | For an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If the memory address is in a non-canonical form. |
| | X | X | | | If any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF(fault-code) | | X | X | X | For a page fault. |
| Alignment Check #AC(0) | | X | X | X | For 2, 4, or 8 byte memory access if alignment checking is enabled and an unaligned memory access is made while the current privilege level is 3. |
| SIMD Floating-point Exception, #XM | X | X | X | X | If an unmasked SIMD floating-point exception, {sae} or {er} not set, and CR4.OSXMMEXCPT[bit 10] = 1. |

2.8.4 Exceptions Type E4 and E4NF of EVEX-Encoded Instructions

EVEX-encoded vector instructions that cause no SIMD FP exception and support memory fault suppression follow exception class E4.

Table 2-51. Type E4 Class Exception Conditions

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|----------------------------|------|---------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | | | If EVEX prefix present. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: <ul style="list-style-type: none"> State requirement, Table 2-39 not met. Opcode independent #UD condition in Table 2-40. Operand encoding #UD conditions in Table 2-41. Opmask encoding #UD condition of Table 2-42. EVEX.b encoding #UD condition of Table 2-43 and in E4.nb subclass (see E4.nb entries in Table 2-45). Instruction specific EVEX.L'L restriction not met. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a EVEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | If fault suppression not set, and an illegal address in the SS segment. |
| | | | | X | If fault suppression not set, and a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | If fault suppression not set, and an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If fault suppression not set, and the memory address is in a non-canonical form. |
| | X | X | | | If fault suppression not set, and any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF(fault-code) | | X | X | X | If fault suppression not set, and a page fault. |
| Alignment Check #AC(0) | | X | X | X | For 2, 4, or 8 byte memory access if alignment checking is enabled and an unaligned memory access is made while the current privilege level is 3. |

EVEX-encoded vector instructions that do not cause SIMD FP exception nor support memory fault suppression follow exception class E4NF.

Table 2-52. Type E4NF Class Exception Conditions

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|----------------------------|------|---------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | | | If EVEX prefix present. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: <ul style="list-style-type: none"> State requirement, Table 2-39 not met. Opcode independent #UD condition in Table 2-40. Operand encoding #UD conditions in Table 2-41. Opmask encoding #UD condition of Table 2-42. EVEX.b encoding #UD condition of Table 2-43 and in E4NF.nb subclass (see E4NF.nb entries in Table 2-45). Instruction specific EVEX.L'L restriction not met. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a EVEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | For an illegal address in the SS segment. |
| | | | | X | If a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | For an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If the memory address is in a non-canonical form. |
| | X | X | | | If any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF(fault-code) | | X | X | X | For a page fault. |

2.8.5 Exceptions Type E5 and E5NF

EVEX-encoded scalar/partial-vector instructions that cause no SIMD FP exception and support memory fault suppression follow exception class E5.

Table 2-53. Type E5 Class Exception Conditions

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|----------------------------|------|---------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | | | If EVEX prefix present. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: <ul style="list-style-type: none"> ▪ State requirement, Table 2-39 not met. ▪ Opcode independent #UD condition in Table 2-40. ▪ Operand encoding #UD conditions in Table 2-41. ▪ Opmask encoding #UD condition of Table 2-42. ▪ EVEX.b encoding #UD condition of Table 2-43. ▪ Instruction specific EVEX.L'L restriction not met. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a EVEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | If fault suppression not set, and an illegal address in the SS segment. |
| | | | | X | If fault suppression not set, and a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | If fault suppression not set, and an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If fault suppression not set, and the memory address is in a non-canonical form. |
| | X | X | | | If fault suppression not set, and any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF(fault-code) | | X | X | X | If fault suppression not set, and a page fault. |
| Alignment Check #AC(0) | | X | X | X | For 2, 4, or 8 byte memory access if alignment checking is enabled and an unaligned memory access is made while the current privilege level is 3. |

EVEX-encoded scalar/partial vector instructions that do not cause SIMD FP exception nor support memory fault suppression follow exception class E5NF.

Table 2-54. Type E5NF Class Exception Conditions

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|----------------------------|------|---------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | | | If EVEX prefix present. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: <ul style="list-style-type: none"> ▪ State requirement, Table 2-39 not met. ▪ Opcode independent #UD condition in Table 2-40. ▪ Operand encoding #UD conditions in Table 2-41. ▪ Opmask encoding #UD condition of Table 2-42. ▪ EVEX.b encoding #UD condition of Table 2-43. ▪ Instruction specific EVEX.L'L restriction not met. |
| | X | X | X | X | If preceded by a LOCK prefix (FOH). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a EVEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | If an illegal address in the SS segment. |
| | | | | X | If a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | If an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If the memory address is in a non-canonical form. |
| | X | X | | | If any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF(fault-code) | | X | X | X | For a page fault. |
| Alignment Check #AC(0) | | X | X | X | For 2, 4, or 8 byte memory access if alignment checking is enabled and an unaligned memory access is made while the current privilege level is 3. |

2.8.6 Exceptions Type E6 and E6NF

Table 2-55. Type E6 Class Exception Conditions

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|----------------------------|------|---------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | | | If EVEX prefix present. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: <ul style="list-style-type: none"> State requirement, Table 2-39 not met. Opcode independent #UD condition in Table 2-40. Operand encoding #UD conditions in Table 2-41. Opmask encoding #UD condition of Table 2-42. EVEX.b encoding #UD condition of Table 2-43. Instruction specific EVEX.L'L restriction not met. |
| | | | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a EVEX prefix. |
| | | | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | | | X | X | If CR0.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | If fault suppression not set, and an illegal address in the SS segment. |
| | | | | X | If fault suppression not set, and a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | If fault suppression not set, and an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If fault suppression not set, and the memory address is in a non-canonical form. |
| Page Fault #PF(fault-code) | | | X | X | If fault suppression not set, and a page fault. |
| Alignment Check #AC(0) | | | X | X | For 2, 4, or 8 byte memory access if alignment checking is enabled and an unaligned memory access is made while the current privilege level is 3. |

EVEX-encoded instructions that do not cause SIMD FP exception nor support memory fault suppression follow exception class E6NF.

Table 2-56. Type E6NF Class Exception Conditions

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|----------------------------|------|---------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | | | If EVEX prefix present. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: <ul style="list-style-type: none"> State requirement, Table 2-39 not met. Opcode independent #UD condition in Table 2-40. Operand encoding #UD conditions in Table 2-41. Opmask encoding #UD condition of Table 2-42. EVEX.b encoding #UD condition of Table 2-43. Instruction specific EVEX.L'L restriction not met. |
| | | | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a EVEX prefix. |
| | | | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | | | X | X | If CR0.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | For an illegal address in the SS segment. |
| | | | | X | If a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | For an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If the memory address is in a non-canonical form. |
| Page Fault #PF(fault-code) | | | X | X | For a page fault. |
| Alignment Check #AC(0) | | | X | X | For 2, 4, or 8 byte memory access if alignment checking is enabled and an unaligned memory access is made while the current privilege level is 3. |

2.8.7 Exceptions Type E7NM

EVEX-encoded instructions that cause no SIMD FP exception and do not reference memory follow exception class E7NM.

Table 2-57. Type E7NM Class Exception Conditions

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|---------------------------|------|---------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | | | If EVEX prefix present. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: <ul style="list-style-type: none"> ▪ State requirement, Table 2-39 not met. ▪ Opcode independent #UD condition in Table 2-40. ▪ Operand encoding #UD conditions in Table 2-41. ▪ Opmask encoding #UD condition of Table 2-42. ▪ EVEX.b encoding #UD condition of Table 2-43. ▪ Instruction specific EVEX.L'L restriction not met. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a EVEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | | | X | X | If CR0.TS[bit 3]=1. |

2.8.8 Exceptions Type E9 and E9NF

EVEX-encoded vector or partial-vector instructions that do not cause no SIMD FP exception and support memory fault suppression follow exception class E9.

Table 2-58. Type E9 Class Exception Conditions

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|---------------------|------|---------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | | | If EVEX prefix present. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: <ul style="list-style-type: none"> ▪ State requirement, Table 2-39 not met. ▪ Opcode independent #UD condition in Table 2-40. ▪ Operand encoding #UD conditions in Table 2-41. ▪ Opmask encoding #UD condition of Table 2-42. ▪ EVEX.b encoding #UD condition of Table 2-43. ▪ Instruction specific EVEX.L'L restriction not met. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a EVEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |

Table 2-58. Type E9 Class Exception Conditions

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|----------------------------|------|---------------|-----------------------------|--------|---|
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | If fault suppression not set, and an illegal address in the SS segment. |
| | | | | X | If fault suppression not set, and a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | If fault suppression not set, and an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If fault suppression not set, and the memory address is in a non-canonical form. |
| | X | X | | | If fault suppression not set, and any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF(fault-code) | | X | X | X | If fault suppression not set, and a page fault. |
| Alignment Check #AC(0) | | X | X | X | For 2, 4, or 8 byte memory access if alignment checking is enabled and an unaligned memory access is made while the current privilege level is 3. |

EVEX-encoded vector or partial-vector instructions that must be encoded with VEX.L'L = 0, do not cause SIMD FP exception nor support memory fault suppression follow exception class E9NF.

Table 2-59. Type E9NF Class Exception Conditions

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|----------------------------|------|---------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | | | If EVEX prefix present. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: <ul style="list-style-type: none"> State requirement, Table 2-39 not met. Opcode independent #UD condition in Table 2-40. Operand encoding #UD conditions in Table 2-41. Opmask encoding #UD condition of Table 2-42. EVEX.b encoding #UD condition of Table 2-43. Instruction specific EVEX.L'L restriction not met. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a EVEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | If an illegal address in the SS segment. |
| | | | | X | If a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | If an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If the memory address is in a non-canonical form. |
| | X | X | | | If any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF(fault-code) | | X | X | X | For a page fault. |
| Alignment Check #AC(0) | | X | X | X | For 2, 4, or 8 byte memory access if alignment checking is enabled and an unaligned memory access is made while the current privilege level is 3. |

2.8.9 Exceptions Type E10 and E10NF

EVEX-encoded scalar instructions that ignore EVEX.L'L vector length encoding, do not cause a SIMD FP exception, and support memory fault suppression follow exception class E10.

Table 2-60. Type E10 Class Exception Conditions

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|----------------------------|------|---------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | | | If EVEX prefix present. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: <ul style="list-style-type: none"> ▪ State requirement, Table 2-39 not met. ▪ Opcode independent #UD condition in Table 2-40. ▪ Operand encoding #UD conditions in Table 2-41. ▪ Opmask encoding #UD condition of Table 2-42. ▪ EVEX.b encoding #UD condition of Table 2-43. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a EVEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | If fault suppression not set, and an illegal address in the SS segment. |
| | | | | X | If fault suppression not set, and a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | If fault suppression not set, and an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If fault suppression not set, and the memory address is in a non-canonical form. |
| | X | X | | | If fault suppression not set, and any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF(fault-code) | | X | X | X | If fault suppression not set, and a page fault. |
| Alignment Check #AC(0) | | X | X | X | For 2, 4, or 8 byte memory access if alignment checking is enabled and an unaligned memory access is made while the current privilege level is 3. |

EVEX-encoded scalar instructions that ignore EVEX.L'L vector length encoding, do not cause a SIMD FP exception, and do not support memory fault suppression follow exception class E10NF.

Table 2-61. Type E10NF Class Exception Conditions

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|----------------------------|------|---------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | | | If EVEX prefix present. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: <ul style="list-style-type: none"> State requirement, Table 2-39 not met. Opcode independent #UD condition in Table 2-40. Operand encoding #UD conditions in Table 2-41. Opmask encoding #UD condition of Table 2-42. EVEX.b encoding #UD condition of Table 2-43. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a EVEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | If fault suppression not set, and an illegal address in the SS segment. |
| | | | | X | If fault suppression not set, and a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | If fault suppression not set, and an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If fault suppression not set, and the memory address is in a non-canonical form. |
| | X | X | | | If fault suppression not set, and any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF(fault-code) | | X | X | X | If fault suppression not set, and a page fault. |
| Alignment Check #AC(0) | | X | X | X | For 2, 4, or 8 byte memory access if alignment checking is enabled and an unaligned memory access is made while the current privilege level is 3. |

2.8.10 Exceptions Type E11 (EVEX-only, Mem Arg, No AC, Floating-point Exceptions)

EVEX-encoded instructions that can cause SIMD FP exception, memory operand support fault suppression but do not cause #AC follow exception class E11.

Table 2-62. Type E11 Class Exception Conditions

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|------------------------------------|------|---------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | | | If EVEX prefix present. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: <ul style="list-style-type: none"> ▪ State requirement, Table 2-39 not met. ▪ Opcode independent #UD condition in Table 2-40. ▪ Operand encoding #UD conditions in Table 2-41. ▪ Opmask encoding #UD condition of Table 2-42. ▪ EVEX.b encoding #UD condition of Table 2-43. ▪ Instruction specific EVEX.L'L restriction not met. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a EVEX prefix. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | If fault suppression not set, and an illegal address in the SS segment. |
| | | | | X | If fault suppression not set, and a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | If fault suppression not set, and an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If fault suppression not set, and the memory address is in a non-canonical form. |
| | X | X | | | If fault suppression not set, and any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF (fault-code) | | X | X | X | If fault suppression not set, and a page fault. |
| SIMD Floating-Point Exception, #XM | X | X | X | X | If an unmasked SIMD floating-point exception, {sae} not set, and CR4.OSXMMEX-CPT[bit 10] = 1. |

2.8.11 Exceptions Type E12 and E12NP (VSIB Mem Arg, No AC, No Floating-point Exceptions)

Table 2-63. Type E12 Class Exception Conditions

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|-----------------------------|------|---------------|-----------------------------|--------|---|
| Invalid Opcode, #UD | X | X | | | If EVEX prefix present. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: <ul style="list-style-type: none"> State requirement, Table 2-39 not met. Opcode independent #UD condition in Table 2-40. Operand encoding #UD conditions in Table 2-41. Opmask encoding #UD condition of Table 2-42. EVEX.b encoding #UD condition of Table 2-43. Instruction specific EVEX.L'L restriction not met. If vvvv != 1111b. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a VEX prefix. |
| | X | X | X | NA | If address size attribute is 16 bit. |
| | X | X | X | X | If ModR/M.mod = '11b'. |
| | X | X | X | X | If ModR/M.rm != '100b'. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| | X | X | X | X | If k0 is used (gather or scatter operation). |
| | X | X | X | X | If index = destination register (gather operation). |
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |
| Stack, #SS(0) | | | X | | For an illegal address in the SS segment. |
| | | | | X | If a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | For an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| | | | | X | If the memory address is in a non-canonical form. |
| | X | X | | | If any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF (fault-code) | | X | X | X | For a page fault. |

EVEX-encoded prefetch instructions that do not cause #PF follow exception class E12NP.

Table 2-64. Type E12NP Class Exception Conditions

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|---------------------------|------|---------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | | | If EVEX prefix present. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: <ul style="list-style-type: none"> State requirement, Table 2-39 not met. Opcode independent #UD condition in Table 2-40. Operand encoding #UD conditions in Table 2-41. Opmask encoding #UD condition of Table 2-42. EVEX.b encoding #UD condition of Table 2-43. Instruction specific EVEX.L'L restriction not met. |
| | X | X | X | X | If preceded by a LOCK prefix (F0H). |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a VEX prefix. |
| | X | X | X | NA | If address size attribute is 16 bit. |
| | X | X | X | X | If ModR/M.mod = '11b'. |
| | X | X | X | X | If ModR/M.rm != '100b'. |
| | X | X | X | X | If any corresponding CPUID feature flag is '0'. |
| | X | X | X | X | If k0 is used (gather or scatter operation). |
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |

2.9 EXCEPTION CLASSIFICATIONS OF OPMASK INSTRUCTIONS, TYPE K20 AND TYPE K21

The exception behavior of VEX-encoded opmask instructions are listed below.

2.9.1 Exceptions Type K20

Exception conditions of Opmask instructions that do not address memory are listed as Type K20.

Table 2-65. TYPE K20 Exception Definition (VEX-Encoded OpMask Instructions w/o Memory Arg)

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|---------------------------|------|---------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | X | X | If relevant CPUID feature flag is '0'. |
| | X | X | | | If a VEX prefix is present. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: <ul style="list-style-type: none"> State requirement, Table 2-39 not met. Opcode independent #UD condition in Table 2-40. Operand encoding #UD conditions in Table 2-41. |
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a VEX prefix. |
| | | | X | X | If ModRM:[7:6] != 11b. |
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |

2.9.2 Exceptions Type K21

Exception conditions of Opmask instructions that address memory are listed as Type K21.

Table 2-66. TYPE K21 Exception Definition (VEX-Encoded OpMask Instructions Addressing Memory)

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|---------------------------|------|---------------|-----------------------------|--------|--|
| Invalid Opcode, #UD | X | X | X | X | If relevant CPUID feature flag is '0'. |
| | X | X | | | If a VEX prefix is present. |
| | | | X | X | If CR4.OSXSAVE[bit 18]=0. If any one of following conditions applies: <ul style="list-style-type: none"> State requirement, Table 2-39 not met. Opcode independent #UD condition in Table 2-40. Operand encoding #UD conditions in Table 2-41. |
| Device Not Available, #NM | X | X | X | X | If CR0.TS[bit 3]=1. |

Table 2-66. TYPE K21 Exception Definition (VEX-Encoded OpMask Instructions Addressing Memory)

| Exception | Real | Virtual 80x86 | Protected and Compatibility | 64-bit | Cause of Exception |
|----------------------------|------|---------------|-----------------------------|--------|--|
| | | | X | X | If any REX, F2, F3, or 66 prefixes precede a VEX prefix. |
| Stack, #SS(0) | X | X | X | | For an illegal address in the SS segment. |
| | | | | X | If a memory address referencing the SS segment is in a non-canonical form. |
| General Protection, #GP(0) | | | X | | For an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. If the DS, ES, FS, or GS register is used to access memory and it contains a null segment selector. |
| | | | | X | If the memory address is in a non-canonical form. |
| | X | X | | | If any part of the operand lies outside the effective address space from 0 to FFFFH. |
| Page Fault #PF(fault-code) | | X | X | X | For a page fault. |
| Alignment Check #AC(0) | | X | X | X | For 2, 4, or 8 byte memory access if alignment checking is enabled and an unaligned memory access is made while the current privilege level is 3. |

2.10 INTEL® AMX INSTRUCTION EXCEPTION CLASSES

Alignment exceptions: The Intel AMX instructions that access memory will never generate #AC exceptions.

Table 2-67. Intel® AMX Exception Classes

| Class | Description |
|--------|--|
| AMX-E1 | <ul style="list-style-type: none"> • #UD if preceded by LOCK, 66H, F2H, F3H or REX prefixes. • #UD if CR4.OSXSAVE ≠ 1. • #UD if XCR0[18:17] ≠ 0b11. • #UD if IA32_EFER.LMA ≠ 1 OR CS.L ≠ 1. • #UD if VVVV ≠ 0b1111. |
| | <ul style="list-style-type: none"> • #GP based on palette and configuration checks (see pseudocode). • #GP if the memory address is in a non-canonical form. |
| | • #SS(0) if the memory address referencing the SS segment is in a non-canonical form. |
| | • #PF if a page fault occurs. |
| AMX-E2 | <ul style="list-style-type: none"> • #UD if preceded by LOCK, 66H, F2H, F3H or REX prefixes. • #UD if CR4.OSXSAVE ≠ 1. • #UD if XCR0[18:17] ≠ 0b11. • #UD if IA32_EFER.LMA ≠ 1 OR CS.L ≠ 1. • #UD if VVVV ≠ 0b1111. |
| | • #GP if the memory address is in a non-canonical form. |
| | • #SS(0) if the memory address referencing the SS segment is in a non-canonical form. |
| | • #PF if a page fault occurs. |

Table 2-67. Intel® AMX Exception Classes (Contd.)

| Class | Description |
|--------|--|
| AMX-E3 | <ul style="list-style-type: none"> • #UD if preceded by LOCK, 66H, F2H, F3H or REX prefixes. • #UD if CR4.OSXSAVE \neq 1. • #UD if XCR0[18:17] \neq 0b11. • #UD if IA32_EFER.LMA \neq 1 OR CS.L \neq 1. • #UD if VVVV \neq 0b1111. • #UD if not using SIB addressing. • #UD if TILES_CONFIGURED == 0. • #UD if tsrc or tdest are not valid tiles. • #UD if tsrc/tdest are \geq palette_table[tilecfg.palette_id].max_names. • #UD if tsrc.colbytes mod 4 \neq 0 OR tdest.colbytes mod 4 \neq 0. • #UD if tilecfg.start_row \geq tsrc.rows OR tilecfg.start_row \geq tdest.rows. |
| | • #GP if the memory address is in a non-canonical form. |
| | • #SS(0) if the memory address referencing the SS segment is in a non-canonical form. |
| | • #PF if any memory operand causes a page fault. |
| | • #NM if XFD[18] == 1. |
| AMX-E4 | <ul style="list-style-type: none"> • #UD if preceded by LOCK, 66H, F2H, F3H or REX prefixes. • #UD if CR4.OSXSAVE \neq 1. • #UD if XCR0[18:17] \neq 0b11. • #UD if IA32_EFER.LMA \neq 1 OR CS.L \neq 1. • #UD if srcdest == src1 OR src1 == src2 OR srcdest == src2. • #UD if TILES_CONFIGURED == 0. • #UD if srcdest.colbytes mod 4 \neq 0. • #UD if src1.colbytes mod 4 \neq 0. • #UD if src2.colbytes mod 4 \neq 0. • #UD if srcdest/src1/src2 are not valid tiles. • #UD if srcdest/src1/src2 are \geq palette_table[tilecfg.palette_id].max_names. • #UD if srcdest.colbytes \neq src2.colbytes. • #UD if srcdest.rows \neq src1.rows. • #UD if src1.colbytes / 4 \neq src2.rows. • #UD if srcdest.colbytes > tmul_maxn. • #UD if src2.colbytes > tmul_maxn. • #UD if src1.colbytes/4 > tmul_maxk. • #UD if src2.rows > tmul_maxk. |
| | • #NM if XFD[18] == 1. |
| AMX-E5 | <ul style="list-style-type: none"> • #UD if preceded by LOCK, 66H, F2H, F3H or REX prefixes. • #UD if CR4.OSXSAVE \neq 1. • #UD if XCR0[18:17] \neq 0b11. • #UD if IA32_EFER.LMA \neq 1 OR CS.L \neq 1. • #UD if VVVV \neq 0b1111. • #UD if TILES_CONFIGURED == 0. • #UD if tdest is not a valid tile. • #UD if tdest is \geq palette_table[tilecfg.palette_id].max_names. |
| | • #NM if XFD[18] == 1. |
| AMX-E6 | <ul style="list-style-type: none"> • #UD if preceded by LOCK, 66H, F2H, F3H or REX prefixes. • #UD if CR4.OSXSAVE \neq 1. • #UD if XCR0[18:17] \neq 0b11. • #UD if IA32_EFER.LMA \neq 1 OR CS.L \neq 1. • #UD if VVVV \neq 0b1111. |

CHAPTER 3 INSTRUCTION SET REFERENCE, A-L

This chapter describes the instruction set for the Intel 64 and IA-32 architectures (A-L) in IA-32e, protected, virtual-8086, and real-address modes of operation. The set includes general-purpose, x87 FPU, MMX, SSE/SSE2/SSE3/SSSE3/SSE4, AESNI/PCLMULQDQ, AVX, and system instructions. See also Chapter 4, “Instruction Set Reference, M-U,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2B; Chapter 5, “Instruction Set Reference, V,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2C; and Chapter 6, “Instruction Set Reference, W-Z,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2D.

For each instruction, each operand combination is described. A description of the instruction and its operand, an operational description, a description of the effect of the instructions on flags in the EFLAGS register, and a summary of exceptions that can be generated are also provided.

3.1 INTERPRETING THE INSTRUCTION REFERENCE PAGES

This section describes the format of information contained in the instruction reference pages in this chapter. It explains notational conventions and abbreviations used in these sections.

3.1.1 Instruction Format

The following is an example of the format used for each instruction description in this chapter. The heading below introduces the example. The table below provides an example summary table.

CMC—Complement Carry Flag [this is an example]

| Opcode | Instruction | Op/En | 64/32-bit Mode | CPUID Feature Flag | Description |
|--------|-------------|-------|----------------|--------------------|------------------------|
| F5 | CMC | Z0 | V/V | N/A | Complement carry flag. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

3.1.1.1 Opcode Column in the Instruction Summary Table (Instructions without VEX Prefix)

The “Opcode” column in the table above shows the object code produced for each form of the instruction. When possible, codes are given as hexadecimal bytes in the same order in which they appear in memory. Definitions of entries other than hexadecimal bytes are as follows:

- **NP** — Indicates the use of 66/F2/F3 prefixes (beyond those already part of the instructions opcode) are not allowed with the instruction. Such use will either cause an invalid-opcode exception (#UD) or result in the encoding for a different instruction.
- **NF_x** — Indicates the use of F2/F3 prefixes (beyond those already part of the instructions opcode) are not allowed with the instruction. Such use will either cause an invalid-opcode exception (#UD) or result in the encoding for a different instruction.
- **REX.W** — Indicates the use of a REX prefix that affects operand size or instruction semantics. The ordering of the REX prefix and other optional/mandatory instruction prefixes are discussed Chapter 2. Note that REX prefixes that promote legacy instructions to 64-bit behavior are not listed explicitly in the opcode column.
- **/digit** — A digit between 0 and 7 indicates that the ModR/M byte of the instruction uses only the r/m (register or memory) operand. The reg field contains the digit that provides an extension to the instruction's opcode.
- **/r** — Indicates that the ModR/M byte of the instruction contains a register operand and an r/m operand.
- **cb, cw, cd, cp, co, ct** — A 1-byte (cb), 2-byte (cw), 4-byte (cd), 6-byte (cp), 8-byte (co) or 10-byte (ct) value following the opcode. This value is used to specify a code offset and possibly a new value for the code segment register.
- **ib, iw, id, io** — A 1-byte (ib), 2-byte (iw), 4-byte (id) or 8-byte (io) immediate operand to the instruction that follows the opcode, ModR/M bytes or scale-indexing bytes. The opcode determines if the operand is a signed value. All words, doublewords, and quadwords are given with the low-order byte first.
- **+rb, +rw, +rd, +ro** — Indicated the lower 3 bits of the opcode byte is used to encode the register operand without a modR/M byte. The instruction lists the corresponding hexadecimal value of the opcode byte with low 3 bits as 000b. In non-64-bit mode, a register code, from 0 through 7, is added to the hexadecimal value of the opcode byte. In 64-bit mode, indicates the four bit field of REX.b and opcode[2:0] field encodes the register operand of the instruction. “+ro” is applicable only in 64-bit mode. See Table 3-1 for the codes.
- **+i** — A number used in floating-point instructions when one of the operands is ST(i) from the FPU register stack. The number i (which can range from 0 to 7) is added to the hexadecimal byte given at the left of the plus sign to form a single opcode byte.

Table 3-1. Register Codes Associated With +rb, +rw, +rd, +ro

| byte register | | | word register | | | dword register | | | quadword register (64-Bit Mode only) | | |
|---------------|----------------------|-----------|---------------|-------|-----------|----------------|-------|-----------|---|-------|-----------|
| Register | REX.B | Reg Field | Register | REX.B | Reg Field | Register | REX.B | Reg Field | Register | REX.B | Reg Field |
| AL | None | 0 | AX | None | 0 | EAX | None | 0 | RAX | None | 0 |
| CL | None | 1 | CX | None | 1 | ECX | None | 1 | RCX | None | 1 |
| DL | None | 2 | DX | None | 2 | EDX | None | 2 | RDX | None | 2 |
| BL | None | 3 | BX | None | 3 | EBX | None | 3 | RBX | None | 3 |
| AH | Not encodable (N.E.) | 4 | SP | None | 4 | ESP | None | 4 | N/A | N/A | N/A |
| CH | N.E. | 5 | BP | None | 5 | EBP | None | 5 | N/A | N/A | N/A |
| DH | N.E. | 6 | SI | None | 6 | ESI | None | 6 | N/A | N/A | N/A |
| BH | N.E. | 7 | DI | None | 7 | EDI | None | 7 | N/A | N/A | N/A |
| SPL | Yes | 4 | SP | None | 4 | ESP | None | 4 | RSP | None | 4 |
| BPL | Yes | 5 | BP | None | 5 | EBP | None | 5 | RBP | None | 5 |

Table 3-1. Register Codes Associated With +rb, +rw, +rd, +ro (Contd.)

| byte register | | | word register | | | dword register | | | quadword register (64-Bit Mode only) | | |
|---|-------|-----------|---------------|-------|-----------|----------------|-------|-----------|---|-------|-----------|
| Register | REX.B | Reg Field | Register | REX.B | Reg Field | Register | REX.B | Reg Field | Register | REX.B | Reg Field |
| SIL | Yes | 6 | SI | None | 6 | ESI | None | 6 | RSI | None | 6 |
| DIL | Yes | 7 | DI | None | 7 | EDI | None | 7 | RDI | None | 7 |
| Registers R8 - R15 (see below): Available in 64-Bit Mode Only | | | | | | | | | | | |
| R8B | Yes | 0 | R8W | Yes | 0 | R8D | Yes | 0 | R8 | Yes | 0 |
| R9B | Yes | 1 | R9W | Yes | 1 | R9D | Yes | 1 | R9 | Yes | 1 |
| R10B | Yes | 2 | R10W | Yes | 2 | R10D | Yes | 2 | R10 | Yes | 2 |
| R11B | Yes | 3 | R11W | Yes | 3 | R11D | Yes | 3 | R11 | Yes | 3 |
| R12B | Yes | 4 | R12W | Yes | 4 | R12D | Yes | 4 | R12 | Yes | 4 |
| R13B | Yes | 5 | R13W | Yes | 5 | R13D | Yes | 5 | R13 | Yes | 5 |
| R14B | Yes | 6 | R14W | Yes | 6 | R14D | Yes | 6 | R14 | Yes | 6 |
| R15B | Yes | 7 | R15W | Yes | 7 | R15D | Yes | 7 | R15 | Yes | 7 |

3.1.1.2 Opcode Column in the Instruction Summary Table (Instructions with VEX prefix)

In the Instruction Summary Table, the Opcode column presents each instruction encoded using the VEX prefix in following form (including the modR/M byte if applicable, the immediate byte if applicable):

VEX.[128,256].[66,F2,F3].0F/OF3A/OF38.[W0,W1] opcode [/r] [/ib,/is4]

- **VEX** — Indicates the presence of the VEX prefix is required. The VEX prefix can be encoded using the three-byte form (the first byte is C4H), or using the two-byte form (the first byte is C5H). The two-byte form of VEX only applies to those instructions that do not require the following fields to be encoded: VEX.mmmmm, VEX.W, VEX.X, VEX.B. Refer to Section 2.3 for more detail on the VEX prefix.

The encoding of various sub-fields of the VEX prefix is described using the following notations:

- **128,256:** VEX.L field can be 0 (denoted by VEX.128, VEX.L0, or VEX.LZ) or 1 (denoted by VEX.256 or VEX.L1). The VEX.L field can be encoded using either the 2-byte or 3-byte form of the VEX prefix. The presence of the notation VEX.256 or VEX.128 in the opcode column should be interpreted as follows:
 - If VEX.256 is present in the opcode column: The semantics of the instruction must be encoded with VEX.L = 1. An attempt to encode this instruction with VEX.L = 0 can result in one of two situations: (a) if VEX.128 version is defined, the processor will behave according to the defined VEX.128 behavior; (b) an #UD occurs if there is no VEX.128 version defined.
 - If VEX.128 is present in the opcode column but there is no VEX.256 version defined for the same opcode byte: Two situations apply: (a) For VEX-encoded, 128-bit SIMD integer instructions, software must encode the instruction with VEX.L = 0. The processor will treat the opcode byte encoded with VEX.L = 1 by causing an #UD exception; (b) For VEX-encoded, 128-bit packed floating-point instructions, software must encode the instruction with VEX.L = 0. The processor will treat the opcode byte encoded with VEX.L = 1 by causing an #UD exception (e.g., VMOVLPS).
 - If VEX.L0 or VEX.L1 is present in the opcode column: The specified VEX.L value is required for encoding this instruction but does not have the connotation of specifying vector length.
 - If VEX.LIG is present in the opcode column: The VEX.L value is ignored. This generally applies to VEX-encoded scalar SIMD floating-point instructions. Scalar SIMD floating-point instruction can be distinguished from the mnemonic of the instruction. Generally, the last two letters of the instruction mnemonic would be either "SS", "SD", or "SI" for SIMD floating-point conversion instructions.
 - If VEX.LZ is present in the opcode column: The VEX.L must be encoded to be 0B, an #UD occurs if VEX.L is not zero.

- **66,F2,F3:** The presence or absence of these values map to the VEX.pp field encodings. If absent, this corresponds to VEX.pp=00B. If present, the corresponding VEX.pp value affects the “opcode” byte in the same way as if a SIMD prefix (66H, F2H or F3H) does to the ensuing opcode byte. Thus a non-zero encoding of VEX.pp may be considered as an implied 66H/F2H/F3H prefix. The VEX.pp field may be encoded using either the 2-byte or 3-byte form of the VEX prefix.
- **0F,0F3A,0F38:** The presence maps to a valid encoding of the VEX.mmmmm field. Only three encoded values of VEX.mmmmm are defined as valid, corresponding to the escape byte sequence of 0FH, 0F3AH, and 0F38H. The effect of a valid VEX.mmmmm encoding on the ensuing opcode byte is same as if the corresponding escape byte sequence on the ensuing opcode byte for non-VEX encoded instructions. Thus a valid encoding of VEX.mmmmm may be considered as an implied escape byte sequence of either 0FH, 0F3AH or 0F38H. The VEX.mmmmm field must be encoded using the 3-byte form of VEX prefix.
- **0F,0F3A,0F38 and 2-byte/3-byte VEX:** The presence of 0F3A and 0F38 in the opcode column implies that opcode can only be encoded by the three-byte form of VEX. The presence of 0F in the opcode column does not preclude the opcode to be encoded by the two-byte of VEX if the semantics of the opcode does not require any subfield of VEX not present in the two-byte form of the VEX prefix.
- **W0:** VEX.W=0.
- **W1:** VEX.W=1.
- The presence of W0/W1 in the opcode column applies to two situations: (a) it is treated as an extended opcode bit, (b) the instruction semantics support an operand size promotion to 64-bit of a general-purpose register operand or a 32-bit memory operand. The presence of W1 in the opcode column implies the opcode must be encoded using the 3-byte form of the VEX prefix. The presence of W0 in the opcode column does not preclude the opcode to be encoded using the C5H form of the VEX prefix, if the semantics of the opcode does not require other VEX subfields not present in the two-byte form of the VEX prefix. Please see Section 2.3 on the subfield definitions within VEX.
- **WIG:** can use C5H form (if not requiring VEX.mmmmm) or VEX.W value is ignored in the C4H form of VEX prefix.
- If WIG is present, the instruction may be encoded using either the two-byte form or the three-byte form of VEX. When encoding the instruction using the three-byte form of VEX, the value of VEX.W is ignored.
- **opcode** — Instruction opcode.
- **/is4** — An 8-bit immediate byte is present containing a source register specifier in either imm8[7:4] (for 64-bit mode) or imm8[6:4] (for 32-bit mode), and instruction-specific payload in imm8[3:0].
- In general, the encoding of VEX.R, VEX.X, VEX.B field are not shown explicitly in the opcode column. The encoding scheme of VEX.R, VEX.X, VEX.B fields must follow the rules defined in Section 2.3.

EVEX.[128,256,512,LLIG].[66,F2,F3].0F/0F3A/0F38.[W0,W1,WIG] opcode [/r] [/ib]

- **EVEX** — The EVEX prefix is encoded using the four-byte form (the first byte is 62H). Refer to Section 2.7.1 for more detail on the EVEX prefix.

The encoding of various sub-fields of the EVEX prefix is described using the following notations:

- **128, 256, 512, LLIG:** This corresponds to the vector length; three values are allowed by EVEX: 512-bit, 256-bit and 128-bit. Alternatively, vector length is ignored (LIG) for certain instructions; this typically applies to scalar instructions operating on one data element of a vector register.
- **66,F2,F3:** The presence of these value maps to the EVEX.pp field encodings. The corresponding VEX.pp value affects the “opcode” byte in the same way as if a SIMD prefix (66H, F2H or F3H) does to the ensuing opcode byte. Thus a non-zero encoding of VEX.pp may be considered as an implied 66H/F2H/F3H prefix.
- **0F,0F3A,0F38:** The presence maps to a valid encoding of the EVEX.mmm field. Only three encoded values of EVEX.mmm are defined as valid, corresponding to the escape byte sequence of 0FH, 0F3AH, and 0F38H. The effect of a valid EVEX.mmm encoding on the ensuing opcode byte is the same as if the corresponding escape byte sequence on the ensuing opcode byte for non-EVEX encoded instructions. Thus a valid encoding of EVEX.mmm may be considered as an implied escape byte sequence of either 0FH, 0F3AH or 0F38H.
- **W0:** EVEX.W=0.

- **W1:** EVEX.W=1.
- **WIG:** EVEX.W bit ignored
- **opcode** — Instruction opcode.
- In general, the encoding of EVEX.R and R', EVEX.X and X', and EVEX.B and B' fields are not shown explicitly in the opcode column.

NOTE

Previously, the terms NDS, NDD, and DDS were used in instructions with an EVEX (or VEX) prefix. These terms indicated that the vvvv field was valid for encoding, and specified register usage. These terms are no longer necessary and are redundant with the instruction operand encoding tables provided with each instruction. The instruction operand encoding tables give explicit details on all operands, indicating where every operand is stored and if they are read or written. If vvvv is not listed as an operand in the instruction operand encoding table, then EVEX (or VEX) vvvv must be 0b1111.

3.1.1.3 Instruction Column in the Opcode Summary Table

The “Instruction” column gives the syntax of the instruction statement as it would appear in an ASM386 program. The following is a list of the symbols used to represent operands in the instruction statements:

- **rel8** — A relative address in the range from 128 bytes before the end of the instruction to 127 bytes after the end of the instruction.
- **rel16, rel32** — A relative address within the same code segment as the instruction assembled. The rel16 symbol applies to instructions with an operand-size attribute of 16 bits; the rel32 symbol applies to instructions with an operand-size attribute of 32 bits.
- **ptr16:16, ptr16:32** — A far pointer, typically to a code segment different from that of the instruction. The notation 16:16 indicates that the value of the pointer has two parts. The value to the left of the colon is a 16-bit selector or value destined for the code segment register. The value to the right corresponds to the offset within the destination segment. The ptr16:16 symbol is used when the instruction's operand-size attribute is 16 bits; the ptr16:32 symbol is used when the operand-size attribute is 32 bits.
- **r8** — One of the byte general-purpose registers: AL, CL, DL, BL, AH, CH, DH, BH, BPL, SPL, DIL, and SIL; or one of the byte registers (R8B - R15B) available when using REX.R and 64-bit mode.
- **r16** — One of the word general-purpose registers: AX, CX, DX, BX, SP, BP, SI, DI; or one of the word registers (R8-R15) available when using REX.R and 64-bit mode.
- **r32** — One of the doubleword general-purpose registers: EAX, ECX, EDX, EBX, ESP, EBP, ESI, EDI; or one of the doubleword registers (R8D - R15D) available when using REX.R in 64-bit mode.
- **r64** — One of the quadword general-purpose registers: RAX, RBX, RCX, RDX, RDI, RSI, RBP, RSP, R8-R15. These are available when using REX.R and 64-bit mode.
- **imm8** — An immediate byte value. The imm8 symbol can be a signed number between -128 and +127 inclusive; an unsigned number between 0 and 255 inclusive; or a bitmap when an instruction uses its individual bits. For instructions in which imm8 is combined with a word or doubleword operand, the immediate value is sign-extended to form a word or doubleword. The upper byte of the word is filled with the topmost bit of the immediate value.
- **imm16** — An immediate word value used for instructions whose operand-size attribute is 16 bits. This is a number between -32,768 and +32,767 inclusive.
- **imm32** — An immediate doubleword value used for instructions whose operand-size attribute is 32 bits. It allows the use of a number between +2,147,483,647 and -2,147,483,648 inclusive.
- **imm64** — An immediate quadword value used for instructions whose operand-size attribute is 64 bits. The value allows the use of a number between +9,223,372,036,854,775,807 and -9,223,372,036,854,775,808 inclusive.
- **/ib** — A single-byte value.

- **r/m8** — A byte operand that is either the contents of a byte general-purpose register (AL, CL, DL, BL, AH, CH, DH, BH, BPL, SPL, DIL, and SIL) or a byte from memory. Byte registers R8B - R15B are available using REX.R in 64-bit mode.
- **r/m16** — A word general-purpose register or memory operand used for instructions whose operand-size attribute is 16 bits. The word general-purpose registers are: AX, CX, DX, BX, SP, BP, SI, DI. The contents of memory are found at the address provided by the effective address computation. Word registers R8W - R15W are available using REX.R in 64-bit mode.
- **r/m32** — A doubleword general-purpose register or memory operand used for instructions whose operand-size attribute is 32 bits. The doubleword general-purpose registers are: EAX, ECX, EDX, EBX, ESP, EBP, ESI, EDI. The contents of memory are found at the address provided by the effective address computation. Doubleword registers R8D - R15D are available when using REX.R in 64-bit mode.
- **r/m64** — A quadword general-purpose register or memory operand used for instructions whose operand-size attribute is 64 bits when using REX.W. Quadword general-purpose registers are: RAX, RBX, RCX, RDX, RDI, RSI, RBP, RSP, R8-R15; these are available only in 64-bit mode. The contents of memory are found at the address provided by the effective address computation.
- **reg** — A general-purpose register used for instructions when the width of the register does not matter to the semantics of the operation of the instruction. The register can be r16, r32, or r64.
- **m** — A 16-, 32- or 64-bit operand in memory.
- **m8** — A byte operand in memory, usually expressed as a variable or array name, but pointed to by the DS:(E)SI or ES:(E)DI registers. In 64-bit mode, it is pointed to by the RSI or RDI registers.
- **m16** — A word operand in memory, usually expressed as a variable or array name, but pointed to by the DS:(E)SI or ES:(E)DI registers. This nomenclature is used only with the string instructions.
- **m32** — A doubleword operand in memory. The contents of memory are found at the address provided by the effective address computation.
- **m64** — A memory quadword operand in memory.
- **m128** — A memory double quadword operand in memory.
- **m16:16, m16:32 & m16:64** — A memory operand containing a far pointer composed of two numbers. The number to the left of the colon corresponds to the pointer's segment selector. The number to the right corresponds to its offset.
- **m16&32, m16&16, m32&32, m16&64** — A memory operand consisting of data item pairs whose sizes are indicated on the left and the right side of the ampersand. All memory addressing modes are allowed. The m16&16 and m32&32 operands are used by the BOUND instruction to provide an operand containing an upper and lower bounds for array indices. The m16&32 operand is used by LIDT and LGDT to provide a word with which to load the limit field, and a doubleword with which to load the base field of the corresponding GDTR and IDTR registers. The m16&64 operand is used by LIDT and LGDT in 64-bit mode to provide a word with which to load the limit field, and a quadword with which to load the base field of the corresponding GDTR and IDTR registers.
- **m80bcd** — A Binary Coded Decimal (BCD) operand in memory, 80 bits.
- **mooffs8, mooffs16, mooffs32, mooffs64** — A simple memory variable (memory offset) of type byte, word, or doubleword used by some variants of the MOV instruction. The actual address is given by a simple offset relative to the segment base. No ModR/M byte is used in the instruction. The number shown with mooffs indicates its size, which is determined by the address-size attribute of the instruction.
- **Sreg** — A segment register. The segment register bit assignments are ES = 0, CS = 1, SS = 2, DS = 3, FS = 4, and GS = 5.
- **m32fp, m64fp, m80fp** — A single precision, double precision, and double extended-precision (respectively) floating-point operand in memory. These symbols designate floating-point values that are used as operands for x87 FPU floating-point instructions.
- **m16int, m32int, m64int** — A word, doubleword, and quadword integer (respectively) operand in memory. These symbols designate integers that are used as operands for x87 FPU integer instructions.
- **ST or ST(0)** — The top element of the FPU register stack.
- **ST(i)** — The i^{th} element from the top of the FPU register stack ($i := 0$ through 7).
- **mm** — An MMX register. The 64-bit MMX registers are: MM0 through MM7.

- **mm/m32** — The low order 32 bits of an MMX register or a 32-bit memory operand. The 64-bit MMX registers are: MM0 through MM7. The contents of memory are found at the address provided by the effective address computation.
- **mm/m64** — An MMX register or a 64-bit memory operand. The 64-bit MMX registers are: MM0 through MM7. The contents of memory are found at the address provided by the effective address computation.
- **xmm** — An XMM register. The 128-bit XMM registers are: XMM0 through XMM7; XMM8 through XMM15 are available using REX.R in 64-bit mode.
- **xmm/m32** — An XMM register or a 32-bit memory operand. The 128-bit XMM registers are XMM0 through XMM7; XMM8 through XMM15 are available using REX.R in 64-bit mode. The contents of memory are found at the address provided by the effective address computation.
- **xmm/m64** — An XMM register or a 64-bit memory operand. The 128-bit SIMD floating-point registers are XMM0 through XMM7; XMM8 through XMM15 are available using REX.R in 64-bit mode. The contents of memory are found at the address provided by the effective address computation.
- **xmm/m128** — An XMM register or a 128-bit memory operand. The 128-bit XMM registers are XMM0 through XMM7; XMM8 through XMM15 are available using REX.R in 64-bit mode. The contents of memory are found at the address provided by the effective address computation.
- **<XMM0>** — Indicates implied use of the XMM0 register.
When there is ambiguity, xmm1 indicates the first source operand using an XMM register and xmm2 the second source operand using an XMM register.
Some instructions use the XMM0 register as the third source operand, indicated by <XMM0>. The use of the third XMM register operand is implicit in the instruction encoding and does not affect the ModR/M encoding.
- **ymm** — A YMM register. The 256-bit YMM registers are: YMM0 through YMM7; YMM8 through YMM15 are available in 64-bit mode.
- **m256** — A 32-byte operand in memory. This nomenclature is used only with AVX instructions.
- **ymm/m256** — A YMM register or 256-bit memory operand.
- **<YMM0>** — Indicates use of the YMM0 register as an implicit argument.
- **bnd** — A 128-bit bounds register. BND0 through BND3.
- **mib** — A memory operand using SIB addressing form, where the index register is not used in address calculation, Scale is ignored. Only the base and displacement are used in effective address calculation.
- **m512** — A 64-byte operand in memory.
- **zmm/m512** — A ZMM register or 512-bit memory operand.
- **{k1}{z}** — A mask register used as instruction writemask. The 64-bit k registers are: k1 through k7. Writemask specification is available exclusively via EVEX prefix. The masking can either be done as a merging-masking, where the old values are preserved for masked out elements or as a zeroing masking. The type of masking is determined by using the EVEX.z bit.
- **{k1}** — Without {z}: a mask register used as instruction writemask for instructions that do not allow zeroing-masking but support merging-masking. This corresponds to instructions that require the value of the aaa field to be different than 0 (e.g., gather) and store-type instructions which allow only merging-masking.
- **k1** — A mask register used as a regular operand (either destination or source). The 64-bit k registers are: k0 through k7.
- **mV** — A vector memory operand; the operand size is dependent on the instruction.
- **vm32{x,y,z}** — A vector array of memory operands specified using VSIB memory addressing. The array of memory addresses are specified using a common base register, a constant scale factor, and a vector index register with individual elements of 32-bit index value in an XMM register (vm32x), a YMM register (vm32y) or a ZMM register (vm32z).
- **vm64{x,y,z}** — A vector array of memory operands specified using VSIB memory addressing. The array of memory addresses are specified using a common base register, a constant scale factor, and a vector index register with individual elements of 64-bit index value in an XMM register (vm64x), a YMM register (vm64y) or a ZMM register (vm64z).

- **zmm/m512/m32bcst** — An operand that can be a ZMM register, a 512-bit memory location or a 512-bit vector loaded from a 32-bit memory location.
- **zmm/m512/m64bcst** — An operand that can be a ZMM register, a 512-bit memory location or a 512-bit vector loaded from a 64-bit memory location.
- **<ZMM0>** — Indicates use of the ZMM0 register as an implicit argument.
- **{er}** — Indicates support for embedded rounding control, which is only applicable to the register-register form of the instruction. This also implies support for SAE (Suppress All Exceptions).
- **{sae}** — Indicates support for SAE (Suppress All Exceptions). This is used for instructions that support SAE, but do not support embedded rounding control.
- **SRC1** — Denotes the first source operand in the instruction syntax of an instruction encoded with the VEX/EVEX prefix and having two or more source operands.
- **SRC2** — Denotes the second source operand in the instruction syntax of an instruction encoded with the VEX/EVEX prefix and having two or more source operands.
- **SRC3** — Denotes the third source operand in the instruction syntax of an instruction encoded with the VEX/EVEX prefix and having three source operands.
- **SRC** — The source in a single-source instruction.
- **DST** — The destination in an instruction. This field is encoded by reg_field.

In the instruction encoding, the MODRM byte is represented several ways depending on the role it plays. The MODRM byte has 3 fields: 2-bit MODRM.MOD field, a 3-bit MODRM.REG field and a 3-bit MODRM.RM field. When all bits of the MODRM byte have fixed values for an instruction, the 2-hex nibble value of that byte is presented after the opcode in the encoding boxes on the instruction description pages. When only some fields of the MODRM byte must contain fixed values, those values are specified as follows:

- If only the MODRM.MOD must be 0b11, and MODRM.REG and MODRM.RM fields are unrestricted, this is denoted as **11:rrr:bbb**. The **rrr** correspond to the 3-bits of the MODRM.REG field and the **bbb** correspond to the 3-bits of the MODRM.RM field.
- If the MODRM.MOD field is constrained to be a value other than 0b11, i.e., it must be one of 0b00, 0b01, or 0b10, then we use the notation **!(11)**.
- If the MODRM.REG field had a specific required value, e.g., 0b101, that would be denoted as **mm:101:bbb**.

3.1.1.4 Operand Encoding Column in the Instruction Summary Table

The “operand encoding” column is abbreviated as Op/En in the Instruction Summary table heading. Instruction operand encoding information is provided for each assembly instruction syntax using a letter to cross reference to a row entry in the operand encoding definition table that follows the instruction summary table. The operand encoding table in each instruction reference page lists each instruction operand (according to each instruction syntax and operand ordering shown in the instruction column) relative to the ModRM byte, VEX.vvvv field or additional operand encoding placement.

EVEX encoded instructions employ compressed $\text{disp8} \times N$ encoding of the displacement bytes, where N is defined in Table 2-36 and Table 2-37, according to tuple types. The tuple type for an instruction is listed in the operand encoding definition table where applicable.

NOTES

- The letters in the Op/En column of an instruction apply ONLY to the encoding definition table immediately following the instruction summary table.
- In the encoding definition table, the letter ‘r’ within a pair of parenthesis denotes the content of the operand will be read by the processor. The letter ‘w’ within a pair of parenthesis denotes the content of the operand will be updated by the processor.

3.1.1.5 64/32-bit Mode Column in the Instruction Summary Table

The “64/32-bit Mode” column indicates whether the opcode sequence is supported in (a) 64-bit mode or (b) the Compatibility mode and other IA-32 modes that apply in conjunction with the CPUID feature flag associated specific instruction extensions.

The 64-bit mode support is to the left of the 'slash' and has the following notation:

- **V** — Supported.
- **I** — Not supported.
- **N.E.** — Indicates an instruction syntax is not encodable in 64-bit mode (it may represent part of a sequence of valid instructions in other modes).
- **N.P.** — Indicates the REX prefix does not affect the legacy instruction in 64-bit mode.
- **N.I.** — Indicates the opcode is treated as a new instruction in 64-bit mode.
- **N.S.** — Indicates an instruction syntax that requires an address override prefix in 64-bit mode and is not supported. Using an address override prefix in 64-bit mode may result in model-specific execution behavior.

The Compatibility/Legacy Mode support is to the right of the 'slash' and has the following notation:

- **V** — Supported.
- **I** — Not supported.
- **N.E.** — Indicates an Intel 64 instruction mnemonics/syntax that is not encodable; the opcode sequence is not applicable as an individual instruction in compatibility mode or IA-32 mode. The opcode may represent a valid sequence of legacy IA-32 instructions.

3.1.1.6 CPUID Support Column in the Instruction Summary Table

The fourth column holds abbreviated CPUID feature flags (e.g., appropriate bit in CPUID.01H.ECX, CPUID.01H.EDX for SSE/SSE2/SSE3/SSSE3/SSE4.1/SSE4.2/AESNI/PCLMULQDQ/AVX/RDRAND support) that indicate processor support for the instruction. If the corresponding flag is '0', the instruction will #UD.

3.1.1.7 Description Column in the Instruction Summary Table

The "Description" column briefly explains forms of the instruction.

3.1.1.8 Description Section

Each instruction is then described by number of information sections. The "Description" section describes the purpose of the instructions and required operands in more detail.

Summary of terms that may be used in the description section:

- **Legacy SSE** — Refers to SSE, SSE2, SSE3, SSSE3, SSE4, AESNI, PCLMULQDQ, and any future instruction sets referencing XMM registers and encoded without a VEX prefix.
- **VEX.vvvv** — The VEX bit field specifying a source or destination register (in 1's complement form).
- **rm_field** — shorthand for the ModR/M *r/m* field and any REX.B.
- **reg_field** — shorthand for the ModR/M *reg* field and any REX.R.

3.1.1.9 Operation Section

The "Operation" section contains an algorithm description (frequently written in pseudo-code) for the instruction. Algorithms are composed of the following elements:

- Comments are enclosed within the symbol pairs "(" and ")".
- Compound statements are enclosed in keywords, such as: IF, THEN, ELSE, and FI for an if statement; DO and OD for a do statement; or CASE... OF for a case statement.
- A register name implies the contents of the register. A register name enclosed in brackets implies the contents of the location whose address is contained in that register. For example, ES:[DI] indicates the contents of the location whose ES segment relative address is in register DI. [SI] indicates the contents of the address contained in register SI relative to the SI register's default segment (DS) or the overridden segment.
- Parentheses around the "E" in a general-purpose register name, such as (E)SI, indicates that the offset is read from the SI register if the address-size attribute is 16, from the ESI register if the address-size attribute is 32.

Parentheses around the “R” in a general-purpose register name, (R)SI, in the presence of a 64-bit register definition such as (R)SI, indicates that the offset is read from the 64-bit RSI register if the address-size attribute is 64.

- Brackets are used for memory operands where they mean that the contents of the memory location is a segment-relative offset. For example, [SRC] indicates that the content of the source operand is a segment-relative offset.
- $A := B$ indicates that the value of B is assigned to A.
- The symbols $=$, \neq , $>$, $<$, \geq , and \leq are relational operators used to compare two values: meaning equal, not equal, greater or equal, less or equal, respectively. A relational expression such as $A = B$ is TRUE if the value of A is equal to B; otherwise it is FALSE.
- The expression “ \ll COUNT” and “ \gg COUNT” indicates that the destination operand should be shifted left or right by the number of bits indicated by the count operand.

The following identifiers are used in the algorithmic descriptions:

- **OperandSize and AddressSize** — The OperandSize identifier represents the operand-size attribute of the instruction, which is 16, 32 or 64-bits. The AddressSize identifier represents the address-size attribute, which is 16, 32 or 64-bits. For example, the following pseudo-code indicates that the operand-size attribute depends on the form of the MOV instruction used.

```
IF Instruction = MOVW
    THEN OperandSize := 16;
ELSE
    IF Instruction = MOVD
        THEN OperandSize := 32;
    ELSE
        IF Instruction = MOVQ
            THEN OperandSize := 64;
        FI;
    FI;
FI;
```

See “Operand-Size and Address-Size Attributes” in Chapter 3 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1, for guidelines on how these attributes are determined.

- **StackAddrSize** — Represents the stack address-size attribute associated with the instruction, which has a value of 16, 32 or 64-bits. See “Address-Size Attribute for Stack” in Chapter 6, “Procedure Calls, Interrupts, and Exceptions,” of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1.
- **SRC** — Represents the source operand.
- **DEST** — Represents the destination operand.
- **MAXVL** — The maximum vector register width pertaining to the instruction. This is not the vector-length encoding in the instruction’s encoding but is instead determined by the current value of XCR0. For details, refer to the table below. Note that the value of MAXVL is the largest of the features enabled. Future processors may define new bits in XCR0 whose setting may imply other values for MAXVL.

MAXVL Definition

| XCR0 Component | MAXVL |
|------------------------------------|-------|
| XCR0.SSE | 128 |
| XCR0.AVX | 256 |
| XCR0.{ZMM_Hi256, Hi16_ZMM, OPMASK} | 512 |

The following functions are used in the algorithmic descriptions:

- **ZeroExtend(value)** — Returns a value zero-extended to the operand-size attribute of the instruction. For example, if the operand-size attribute is 32, zero extending a byte value of -10 converts the byte from F6H to

a doubleword value of 000000F6H. If the value passed to the ZeroExtend function and the operand-size attribute are the same size, ZeroExtend returns the value unaltered.

- **SignExtend(value)** — Returns a value sign-extended to the operand-size attribute of the instruction. For example, if the operand-size attribute is 32, sign extending a byte containing the value -10 converts the byte from F6H to a doubleword value of FFFFFFF6H. If the value passed to the SignExtend function and the operand-size attribute are the same size, SignExtend returns the value unaltered.
- **SaturateSignedWordToSignedByte** — Converts a signed 16-bit value to a signed 8-bit value. If the signed 16-bit value is less than -128, it is represented by the saturated value -128 (80H); if it is greater than 127, it is represented by the saturated value 127 (7FH).
- **SaturateSignedDwordToSignedWord** — Converts a signed 32-bit value to a signed 16-bit value. If the signed 32-bit value is less than -32768, it is represented by the saturated value -32768 (8000H); if it is greater than 32767, it is represented by the saturated value 32767 (7FFFH).
- **SaturateSignedWordToUnsignedByte** — Converts a signed 16-bit value to an unsigned 8-bit value. If the signed 16-bit value is less than zero, it is represented by the saturated value zero (00H); if it is greater than 255, it is represented by the saturated value 255 (FFH).
- **SaturateToSignedByte** — Represents the result of an operation as a signed 8-bit value. If the result is less than -128, it is represented by the saturated value -128 (80H); if it is greater than 127, it is represented by the saturated value 127 (7FH).
- **SaturateToSignedWord** — Represents the result of an operation as a signed 16-bit value. If the result is less than -32768, it is represented by the saturated value -32768 (8000H); if it is greater than 32767, it is represented by the saturated value 32767 (7FFFH).
- **SaturateToUnsignedByte** — Represents the result of an operation as a signed 8-bit value. If the result is less than zero it is represented by the saturated value zero (00H); if it is greater than 255, it is represented by the saturated value 255 (FFH).
- **SaturateToUnsignedWord** — Represents the result of an operation as a signed 16-bit value. If the result is less than zero it is represented by the saturated value zero (00H); if it is greater than 65535, it is represented by the saturated value 65535 (FFFFH).
- **LowOrderWord(DEST * SRC)** — Multiplies a word operand by a word operand and stores the least significant word of the doubleword result in the destination operand.
- **HighOrderWord(DEST * SRC)** — Multiplies a word operand by a word operand and stores the most significant word of the doubleword result in the destination operand.
- **Push(value)** — Pushes a value onto the stack. The number of bytes pushed is determined by the operand-size attribute of the instruction. See the “Operation” subsection of the “PUSH—Push Word, Doubleword, or Quadword Onto the Stack” section in Chapter 4 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2B.
- **Pop()** — removes the value from the top of the stack and returns it. The statement `EAX := Pop();` assigns to EAX the 32-bit value from the top of the stack. Pop will return either a word, a doubleword or a quadword depending on the operand-size attribute. See the “Operation” subsection in the “POP—Pop a Value From the Stack” section of Chapter 4 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2B.
- **PopRegisterStack** — Marks the FPU ST(0) register as empty and increments the FPU register stack pointer (TOP) by 1.
- **Switch-Tasks** — Performs a task switch.
- **Bit(BitBase, BitOffset)** — Returns the value of a bit within a bit string. The bit string is a sequence of bits in memory or a register. Bits are numbered from low-order to high-order within registers and within memory bytes. If the BitBase is a register, the BitOffset can be in the range 0 to [15, 31, 63] depending on the mode and register size. See Figure 3-1: the function `Bit[RAX, 21]` is illustrated.

Figure 3-1. Bit Offset for BIT[RAX, 21]

If BitBase is a memory address, the BitOffset has different ranges depending on the operand size (see Table 3-2).

Table 3-2. Range of Bit Positions Specified by Bit Offset Operands

| Operand Size | Immediate BitOffset | Register BitOffset |
|--------------|---------------------|---------------------------|
| 16 | 0 to 15 | -2^{15} to $2^{15} - 1$ |
| 32 | 0 to 31 | -2^{31} to $2^{31} - 1$ |
| 64 | 0 to 63 | -2^{63} to $2^{63} - 1$ |

The addressed bit is numbered (Offset MOD 8) within the byte at address (BitBase + (BitOffset DIV 8)) where DIV is signed division with rounding towards negative infinity and MOD returns a positive number (see Figure 3-2).

Figure 3-2. Memory Bit Indexing

3.1.1.10 Intel® C/C++ Compiler Intrinsics Equivalents Section

The Intel C/C++ compiler intrinsic functions give access to the full power of the Intel Architecture Instruction Set, while allowing the compiler to optimize register allocation and instruction scheduling for faster execution. Most of these functions are associated with a single IA instruction, although some may generate multiple instructions or different instructions depending upon how they are used. In particular, these functions are used to invoke instructions that perform operations on vector registers that can hold multiple data elements. These SIMD instructions use the following data types.

- `__m128`, `__m256`, and `__m512` can represent 4, 8, or 16 packed single precision floating-point values, and are used with the vector registers and SSE, AVX, or AVX-512 instruction set extension families. The `__m128` data type is also used with various single precision floating-point scalar instructions that perform calculations using

only the lowest 32 bits of a vector register; the remaining bits of the result come from one of the sources or are set to zero depending upon the instruction.

- `__m128d`, `__m256d`, and `__m512d` can represent 2, 4, or 8 packed double precision floating-point values, and are used with the vector registers and SSE, AVX, or AVX-512 instruction set extension families. The `__m128d` data type is also used with various double precision floating-point scalar instructions that perform calculations using only the lowest 64 bits of a vector register; the remaining bits of the result come from one of the sources or are set to zero depending upon the instruction.
- `__m128i`, `__m256i`, and `__m512i` can represent integer data in bytes, words, doublewords, quadwords, and occasionally larger data types.

Each of these data types incorporates in its name the number of bits it can hold. For example, the `__m128` type holds 128 bits, and because each single precision floating-point value is 32 bits long the `__m128` type holds (128/32) or four values. Normally the compiler will allocate memory for these data types on an even multiple of the size of the type. Such aligned memory locations may be faster to read and write than locations at other addresses.

These SIMD data types are not basic Standard C data types or C++ objects, so they may be used only with the assignment operator, passed as function arguments, and returned from a function call. If you access the internal members of these types directly, or indirectly by using them in a union, there may be side effects affecting optimization, so it is recommended to use them only with the SIMD instruction intrinsic functions described in this manual or the Intel C/C++ compiler documentation.

Many intrinsic functions names are prefixed with an indicator of the vector length and suffixed by an indicator of the vector element data type, although some functions do not follow the rules below. The prefixes are:

- `_mm_` indicates that the function operates on 128-bit (or sometimes 64-bit) vectors.
- `_mm256_` indicates the function operates on 256-bit vectors.
- `_mm512_` indicates that the function operates on 512-bit vectors.

The suffixes include:

- `_ps`, which indicates a function that operates on packed single precision floating-point data. Packed single precision floating-point data corresponds to arrays of the C/C++ type *float* with either 4, 8 or 16 elements. Values of this type can be loaded from an array using the `_mm_loadu_ps`, `_mm256_loadu_ps`, or `_mm512_loadu_ps` functions, or created from individual values using `_mm_set_ps`, `_mm256_set_ps`, or `_mm512_set_ps` functions, and they can be stored in an array using `_mm_storeu_ps`, `_mm256_storeu_ps`, or `_mm512_storeu_ps`.
- `_ss`, which indicates a function that operates on scalar single precision floating-point data. Single precision floating-point data corresponds to the C/C++ type *float*, and values of type *float* can be converted to type `__m128` for use with these functions using the `_mm_set_ss` function, and converted back using the `_mm_cvtss_f32` function. When used with functions that operate on packed single precision floating-point data the scalar element corresponds with the first packed value.
- `_pd`, which indicates a function that operates on packed double precision floating-point data. Packed double precision floating-point data corresponds to arrays of the C/C++ type *double* with either 2, 4, or 8 elements. Values of this type can be loaded from an array using the `_mm_loadu_pd`, `_mm256_loadu_pd`, or `_mm512_loadu_pd` functions, or created from individual values using `_mm_set_pd`, `_mm256_set_pd`, or `_mm512_set_pd` functions, and they can be stored in an array using `_mm_storeu_pd`, `_mm256_storeu_pd`, or `_mm512_storeu_pd`.
- `_sd`, which indicates a function that operates on scalar double precision floating-point data. Double precision floating-point data corresponds to the C/C++ type *double*, and values of type *double* can be converted to type `__m128d` for use with these functions using the `_mm_set_sd` function, and converted back using the `_mm_cvtsd_f64` function. When used with functions that operate on packed double precision floating-point data the scalar element corresponds with the first packed value.
- `_epi8`, which indicates a function that operates on packed 8-bit signed integer values. Packed 8-bit signed integers correspond to an array of *signed char* with 16, 32 or 64 elements. Values of this type can be created from individual elements using `_mm_set_epi8`, `_mm256_set_epi8`, or `_mm512_set_epi8` functions.
- `_epi16`, which indicates a function that operates on packed 16-bit signed integer values. Packed 16-bit signed integers correspond to an array of *short* with 8, 16 or 32 elements. Values of this type can be created from individual elements using `_mm_set_epi16`, `_mm256_set_epi16`, or `_mm512_set_epi16` functions.

- `_epi32`, which indicates a function that operates on packed 32-bit signed integer values. Packed 32-bit signed integers correspond to an array of *int* with 4, 8 or 16 elements. Values of this type can be created from individual elements using `_mm_set_epi32`, `_mm256_set_epi32`, or `_mm512_set_epi32` functions.
- `_epi64`, which indicates a function that operates on packed 64-bit signed integer values. Packed 64-bit signed integers correspond to an array of *long long* (or *long* if it is a 64-bit data type) with 2, 4 or 8 elements. Values of this type can be created from individual elements using `_mm_set_epi32`, `_mm256_set_epi32`, or `_mm512_set_epi32` functions.
- `_epu8`, which indicates a function that operates on packed 8-bit unsigned integer values. Packed 8-bit unsigned integers correspond to an array of *unsigned char* with 16, 32 or 64 elements.
- `_epu16`, which indicates a function that operates on packed 16-bit unsigned integer values. Packed 16-bit unsigned integers correspond to an array of *unsigned short* with 8, 16 or 32 elements.
- `_epu32`, which indicates a function that operates on packed 32-bit unsigned integer values. Packed 32-bit unsigned integers correspond to an array of *unsigned* with 4, 8 or 16 elements.
- `_epu64`, which indicates a function that operates on packed 64-bit unsigned integer values. Packed 64-bit unsigned integers correspond to an array of *unsigned long long* (or *unsigned long* if it is a 64-bit data type) with 2, 4 or 8 elements.
- `_si128`, which indicates a function that operates on a single 128-bit value of type `__m128i`.
- `_si256`, which indicates a function that operates on a single a 256-bit value of type `__m256i`.
- `_si512`, which indicates a function that operates on a single a 512-bit value of type `__m512i`.

Values of any packed integer type can be loaded from an array using the `_mm_loadu_si128`, `_mm256_loadu_si256`, or `_mm512_loadu_si512` functions, and they can be stored in an array using `_mm_storeu_si128`, `_mm256_storeu_si256`, or `_mm512_storeu_si512`.

These functions and data types are used with the SSE, AVX, and AVX-512 instruction set extension families. In addition there are similar functions that correspond to MMX instructions. These are less frequently used because they require additional state management, and only operate on 64-bit packed integer values.

The declarations of Intel C/C++ compiler intrinsic functions may reference some non-standard data types, such as `__int64`. The C Standard header `stdint.h` defines similar platform-independent types, and the documentation for that header gives characteristics that apply to corresponding non-standard types according to the following table.

Table 3-3. Standard and Non-Standard Data Types

| Non-standard Type | Standard Type (from <code>stdint.h</code>) |
|-------------------------------|---|
| <code>__int64</code> | <code>int64_t</code> |
| <code>unsigned __int64</code> | <code>uint64_t</code> |
| <code>__int32</code> | <code>int32_t</code> |
| <code>unsigned __int32</code> | <code>uint32_t</code> |
| <code>__int16</code> | <code>int16_t</code> |
| <code>unsigned __int16</code> | <code>uint16_t</code> |

For a more detailed description of each intrinsic function and additional information related to its usage, refer to the online Intel Intrinsics Guide, <https://software.intel.com/sites/landingpage/IntrinsicsGuide>.

3.1.1.11 Flags Affected Section

The “Flags Affected” section lists the flags in the EFLAGS register that are affected by the instruction. When a flag is cleared, it is equal to 0; when it is set, it is equal to 1. The arithmetic and logical instructions usually assign values to the status flags in a uniform manner (see Appendix A, “EFLAGS Cross-Reference,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1). Non-conventional assignments are described in the “Operation” section. The values of flags listed as **undefined** may be changed by the instruction in an indeterminate manner. Flags that are not listed are unchanged by the instruction.

3.1.1.12 FPU Flags Affected Section

The floating-point instructions have an “FPU Flags Affected” section that describes how each instruction can affect the four condition code flags of the FPU status word.

3.1.1.13 Protected Mode Exceptions Section

The “Protected Mode Exceptions” section lists the exceptions that can occur when the instruction is executed in protected mode and the reasons for the exceptions. Each exception is given a mnemonic that consists of a pound sign (#) followed by two letters and an optional error code in parentheses. For example, #GP(0) denotes a general protection exception with an error code of 0. Table 3-4 associates each two-letter mnemonic with the corresponding exception vector and name. See Chapter 6, “Procedure Calls, Interrupts, and Exceptions,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A, for a detailed description of the exceptions.

Application programmers should consult the documentation provided with their operating systems to determine the actions taken when exceptions occur.

Table 3-4. Intel 64® and IA-32 General Exceptions

| Vector | Name | Source | Protected Mode ¹ | Real Address Mode | Virtual 8086 Mode |
|--------|--|---|-----------------------------|-------------------|-------------------|
| 0 | #DE—Divide Error | DIV and IDIV instructions. | Yes | Yes | Yes |
| 1 | #DB—Debug | Any code or data reference. | Yes | Yes | Yes |
| 3 | #BP—Breakpoint | INT3 instruction. | Yes | Yes | Yes |
| 4 | #OF—Overflow | INTO instruction. | Yes | Yes | Yes |
| 5 | #BR—BOUND Range Exceeded | BOUND instruction. | Yes | Yes | Yes |
| 6 | #UD—Invalid Opcode (Undefined Opcode) | UD instruction or reserved opcode. | Yes | Yes | Yes |
| 7 | #NM—Device Not Available (No Math Coprocessor) | Floating-point or WAIT/FWAIT instruction. | Yes | Yes | Yes |
| 8 | #DF—Double Fault | Any instruction that can generate an exception, an NMI, or an INTR. | Yes | Yes | Yes |
| 10 | #TS—Invalid TSS | Task switch or TSS access. | Yes | No | Yes |
| 11 | #NP—Segment Not Present | Loading segment registers or accessing system segments. | Yes | No | Yes |
| 12 | #SS—Stack Segment Fault | Stack operations and SS register loads. | Yes | Yes | Yes |
| 13 | #GP—General Protection ² | Any memory reference and other protection checks. | Yes | Yes | Yes |
| 14 | #PF—Page Fault | Any memory reference. | Yes | No | Yes |
| 16 | #MF—Floating-Point Error (Math Fault) | Floating-point or WAIT/FWAIT instruction. | Yes | Yes | Yes |
| 17 | #AC—Alignment Check | Any data reference in memory. | Yes | No | Yes |
| 18 | #MC—Machine Check | Model dependent machine check errors. | Yes | Yes | Yes |
| 19 | #XM—SIMD Floating-Point Numeric Error | SSE/SSE2/SSE3 floating-point instructions. | Yes | Yes | Yes |
| 20 | #VE—Virtualization Exception | EPT violations ³ | Yes | No | No |

Table 3-4. Intel 64® and IA-32 General Exceptions (Contd.)

| Vector | Name | Source | Protected Mode ¹ | Real Address Mode | Virtual 8086 Mode |
|--------|----------------------------------|---|-----------------------------|-------------------|-------------------|
| 21 | #CP—Control Protection Exception | RET, IRET, RSTORSSP, and SETSSBSY instructions can generate this exception. When CET indirect branch tracking is enabled, this exception can be generated due to a missing ENDBRANCH instruction at target of an indirect call or jump. | Yes | No | No |

NOTES:

1. Apply to protected mode, compatibility mode, and 64-bit mode.
2. In the real-address mode, vector 13 is the segment overrun exception.
3. This exception can occur only on processors that support the 1-setting of the “EPT-violation #VE” VM-execution control.

3.1.1.14 Real-Address Mode Exceptions Section

The “Real-Address Mode Exceptions” section lists the exceptions that can occur when the instruction is executed in real-address mode (see Table 3-4).

3.1.1.15 Virtual-8086 Mode Exceptions Section

The “Virtual-8086 Mode Exceptions” section lists the exceptions that can occur when the instruction is executed in virtual-8086 mode (see Table 3-4).

3.1.1.16 Floating-Point Exceptions Section

The “Floating-Point Exceptions” section lists exceptions that can occur when an x87 FPU floating-point instruction is executed. All of these exception conditions result in a floating-point error exception (#MF, exception 16) being generated. Table 3-5 associates a one- or two-letter mnemonic with the corresponding exception name. See “Floating-Point Exception Conditions” in Chapter 8 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1, for a detailed description of these exceptions.

Table 3-5. x87 FPU Floating-Point Exceptions

| Mnemonic | Name | Source |
|------------|--|---|
| #IS #IA | Floating-point invalid operation: - Stack overflow or underflow - Invalid arithmetic operation | - x87 FPU stack overflow or underflow - Invalid FPU arithmetic operation |
| #Z | Floating-point divide-by-zero | Divide-by-zero |
| #D | Floating-point denormal operand | Source operand that is a denormal number |
| #O | Floating-point numeric overflow | Overflow in result |
| #U | Floating-point numeric underflow | Underflow in result |
| #P | Floating-point inexact result (precision) | Inexact result (precision) |

3.1.1.17 SIMD Floating-Point Exceptions Section

The “SIMD Floating-Point Exceptions” section lists exceptions that can occur when an SSE/SSE2/SSE3 floating-point instruction is executed. All of these exception conditions result in a SIMD floating-point error exception (#XM, exception 19) being generated. Table 3-6 associates a one-letter mnemonic with the corresponding exception name. For a detailed description of these exceptions, refer to “SSE and SSE2 Exceptions”, in Chapter 11 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1.

Table 3-6. SIMD Floating-Point Exceptions

| Mnemonic | Name | Source |
|----------|----------------------------------|--|
| #I | Floating-point invalid operation | Invalid arithmetic operation or source operand |
| #Z | Floating-point divide-by-zero | Divide-by-zero |
| #D | Floating-point denormal operand | Source operand that is a denormal number |
| #O | Floating-point numeric overflow | Overflow in result |
| #U | Floating-point numeric underflow | Underflow in result |
| #P | Floating-point inexact result | Inexact result (precision) |

3.1.1.18 Compatibility Mode Exceptions Section

This section lists exceptions that occur within compatibility mode.

3.1.1.19 64-Bit Mode Exceptions Section

This section lists exceptions that occur within 64-bit mode.

3.2 INTEL® AMX CONSIDERATIONS

The following implementation parameters and helper functions are applicable to the Intel® AMX instructions.

3.2.1 Implementation Parameters

The parameters are reported via CPUID leaf 1DH. Index 0 reports all zeros for all fields.

```
define palette_table[id]:
    uint16_t total_tile_bytes
    uint16_t bytes_per_tile
    uint16_t bytes_per_row
    uint16_t max_names
    uint16_t max_rows
```

The tile parameters are set by LDTILECFG or XRSTOR* of TILECFG:

```
define tile[tid]:
    byte rows
    word colsb // bytes_per_row
    bool valid
```

3.2.2 Helper Functions

The helper functions used in Intel AMX instructions are defined below.

```

define write_row_and_zero(treg, r, data, nbytes):
    for j in 0 ...nbytes-1:
        treg.row[r].byte[j] := data.byte[j]

    // zero the rest of the row
    for j in nbytes ... palette_table[tilecfg.palette_id].bytes_per_row-1:
        treg.row[r].byte[j] := 0

define zero_upper_rows(treg, r):
    for i in r ... palette_table[tilecfg.palette_id].max_rows-1:
        for j in 0 ... palette_table[tilecfg.palette_id].bytes_per_row-1:
            treg.row[i].byte[j] := 0

define zero_tilecfg_start():
    tilecfg.start_row :=0

define zero_all_tile_data():
    if XCR0[TILEDATA]:
        b:=CPUID(0xD,TILEDATA).EAX // size of feature
        for j in 0 ... b:
            TILEDATA.byte[j] := 0

define xcr0_supports_palette(palette_id):
    if palette_id == 0:
        return 1
    elif palette_id == 1:
        if XCR0[TILECFG] and XCR0[TILEDATA]:
            return 1
    return 0

```

3.3 INSTRUCTIONS (A-L)

The remainder of this chapter provides descriptions of Intel 64 and IA-32 instructions (A-L). See also: Chapter 4, “Instruction Set Reference, M-U,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2B; Chapter 5, “Instruction Set Reference, V,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2C; and Chapter 6, “Instruction Set Reference, W-Z,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2D.

AAA—ASCII Adjust After Addition

| Opcode | Instruction | Op/En | 64-bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------|-------------|-----------------|---------------------------------|
| 37 | AAA | Z0 | Invalid | Valid | ASCII adjust AL after addition. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Adjusts the sum of two unpacked BCD values to create an unpacked BCD result. The AL register is the implied source and destination operand for this instruction. The AAA instruction is only useful when it follows an ADD instruction that adds (binary addition) two unpacked BCD values and stores a byte result in the AL register. The AAA instruction then adjusts the contents of the AL register to contain the correct 1-digit unpacked BCD result.

If the addition produces a decimal carry, the AH register increments by 1, and the CF and AF flags are set. If there was no decimal carry, the CF and AF flags are cleared and the AH register is unchanged. In either case, bits 4 through 7 of the AL register are set to 0.

This instruction executes as described in compatibility mode and legacy mode. It is not valid in 64-bit mode.

Operation

```
IF 64-Bit Mode
  THEN
    #UD;
  ELSE
    IF ((AL AND 0FH) > 9) or (AF = 1)
      THEN
        AX := AX + 106H;
        AF := 1;
        CF := 1;
      ELSE
        AF := 0;
        CF := 0;
    FI;
    AL := AL AND 0FH;
  FI;
```

Flags Affected

The AF and CF flags are set to 1 if the adjustment results in a decimal carry; otherwise they are set to 0. The OF, SF, ZF, and PF flags are undefined.

Protected Mode Exceptions

#UD If the LOCK prefix is used.

Real-Address Mode Exceptions

Same exceptions as protected mode.

Virtual-8086 Mode Exceptions

Same exceptions as protected mode.

Compatibility Mode Exceptions

Same exceptions as protected mode.

64-Bit Mode Exceptions

#UD If in 64-bit mode.

AAD—ASCII Adjust AX Before Division

| Opcode | Instruction | Op/En | 64-bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------|-------------|-----------------|--|
| D5 0A | AAD | Z0 | Invalid | Valid | ASCII adjust AX before division. |
| D5 ib | AAD imm8 | Z0 | Invalid | Valid | Adjust AX before division to number base imm8. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Adjusts two unpacked BCD digits (the least-significant digit in the AL register and the most-significant digit in the AH register) so that a division operation performed on the result will yield a correct unpacked BCD value. The AAD instruction is only useful when it precedes a DIV instruction that divides (binary division) the adjusted value in the AX register by an unpacked BCD value.

The AAD instruction sets the value in the AL register to $(AL + (10 * AH))$, and then clears the AH register to 00H. The value in the AX register is then equal to the binary equivalent of the original unpacked two-digit (base 10) number in registers AH and AL.

The generalized version of this instruction allows adjustment of two unpacked digits of any number base (see the “Operation” section below), by setting the *imm8* byte to the selected number base (for example, 08H for octal, 0AH for decimal, or 0CH for base 12 numbers). The AAD mnemonic is interpreted by all assemblers to mean adjust ASCII (base 10) values. To adjust values in another number base, the instruction must be hand coded in machine code (D5 *imm8*).

This instruction executes as described in compatibility mode and legacy mode. It is not valid in 64-bit mode.

Operation

```
IF 64-Bit Mode
  THEN
    #UD;
  ELSE
    tempAL := AL;
    tempAH := AH;
    AL := (tempAL + (tempAH * imm8)) AND FFH;
    (* imm8 is set to 0AH for the AAD mnemonic. *)
    AH := 0;
```

FI;

The immediate value (*imm8*) is taken from the second byte of the instruction.

Flags Affected

The SF, ZF, and PF flags are set according to the resulting binary value in the AL register; the OF, AF, and CF flags are undefined.

Protected Mode Exceptions

#UD If the LOCK prefix is used.

Real-Address Mode Exceptions

Same exceptions as protected mode.

Virtual-8086 Mode Exceptions

Same exceptions as protected mode.

Compatibility Mode Exceptions

Same exceptions as protected mode.

64-Bit Mode Exceptions

#UD If in 64-bit mode.

AAM—ASCII Adjust AX After Multiply

| Opcode | Instruction | Op/En | 64-bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------|-------------|-----------------|---|
| D4 0A | AAM | Z0 | Invalid | Valid | ASCII adjust AX after multiply. |
| D4 ib | AAM imm8 | Z0 | Invalid | Valid | Adjust AX after multiply to number base imm8. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Adjusts the result of the multiplication of two unpacked BCD values to create a pair of unpacked (base 10) BCD values. The AX register is the implied source and destination operand for this instruction. The AAM instruction is only useful when it follows an MUL instruction that multiplies (binary multiplication) two unpacked BCD values and stores a word result in the AX register. The AAM instruction then adjusts the contents of the AX register to contain the correct 2-digit unpacked (base 10) BCD result.

The generalized version of this instruction allows adjustment of the contents of the AX to create two unpacked digits of any number base (see the "Operation" section below). Here, the *imm8* byte is set to the selected number base (for example, 08H for octal, 0AH for decimal, or 0CH for base 12 numbers). The AAM mnemonic is interpreted by all assemblers to mean adjust to ASCII (base 10) values. To adjust to values in another number base, the instruction must be hand coded in machine code (D4 *imm8*).

This instruction executes as described in compatibility mode and legacy mode. It is not valid in 64-bit mode.

Operation

```
IF 64-Bit Mode
    THEN
        #UD;
    ELSE
        tempAL := AL;
        AH := tempAL / imm8; (* imm8 is set to 0AH for the AAM mnemonic *)
        AL := tempAL MOD imm8;
FI;
```

The immediate value (*imm8*) is taken from the second byte of the instruction.

Flags Affected

The SF, ZF, and PF flags are set according to the resulting binary value in the AL register. The OF, AF, and CF flags are undefined.

Protected Mode Exceptions

#DE If an immediate value of 0 is used.
#UD If the LOCK prefix is used.

Real-Address Mode Exceptions

Same exceptions as protected mode.

Virtual-8086 Mode Exceptions

Same exceptions as protected mode.

Compatibility Mode Exceptions

Same exceptions as protected mode.

64-Bit Mode Exceptions

#UD If in 64-bit mode.

AAS—ASCII Adjust AL After Subtraction

| Opcode | Instruction | Op/En | 64-bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------|-------------|-----------------|------------------------------------|
| 3F | AAS | Z0 | Invalid | Valid | ASCII adjust AL after subtraction. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Adjusts the result of the subtraction of two unpacked BCD values to create a unpacked BCD result. The AL register is the implied source and destination operand for this instruction. The AAS instruction is only useful when it follows a SUB instruction that subtracts (binary subtraction) one unpacked BCD value from another and stores a byte result in the AL register. The AAA instruction then adjusts the contents of the AL register to contain the correct 1-digit unpacked BCD result.

If the subtraction produced a decimal carry, the AH register decrements by 1, and the CF and AF flags are set. If no decimal carry occurred, the CF and AF flags are cleared, and the AH register is unchanged. In either case, the AL register is left with its top four bits set to 0.

This instruction executes as described in compatibility mode and legacy mode. It is not valid in 64-bit mode.

Operation

```
IF 64-bit mode
  THEN
    #UD;
  ELSE
    IF ((AL AND 0FH) > 9) or (AF = 1)
      THEN
        AX := AX - 6;
        AH := AH - 1;
        AF := 1;
        CF := 1;
        AL := AL AND 0FH;
      ELSE
        CF := 0;
        AF := 0;
        AL := AL AND 0FH;
    FI;
  FI;
```

Flags Affected

The AF and CF flags are set to 1 if there is a decimal borrow; otherwise, they are cleared to 0. The OF, SF, ZF, and PF flags are undefined.

Protected Mode Exceptions

#UD If the LOCK prefix is used.

Real-Address Mode Exceptions

Same exceptions as protected mode.

Virtual-8086 Mode Exceptions

Same exceptions as protected mode.

Compatibility Mode Exceptions

Same exceptions as protected mode.

64-Bit Mode Exceptions

#UD If in 64-bit mode.

ADC—Add With Carry

| Opcode | Instruction | Op/En | 64-bit Mode | Compat/Leg Mode | Description |
|------------------|---|-------|-------------|-----------------|---|
| 14 ib | ADC AL, imm8 | I | Valid | Valid | Add with carry imm8 to AL. |
| 15 iw | ADC AX, imm16 | I | Valid | Valid | Add with carry imm16 to AX. |
| 15 id | ADC EAX, imm32 | I | Valid | Valid | Add with carry imm32 to EAX. |
| REX.W + 15 id | ADC RAX, imm32 | I | Valid | N.E. | Add with carry imm32 sign extended to 64-bits to RAX. |
| 80 /2 ib | ADC r/m8 ¹ , imm8 | MI | Valid | Valid | Add with carry imm8 to r/m8. |
| 81 /2 iw | ADC r/m16, imm16 | MI | Valid | Valid | Add with carry imm16 to r/m16. |
| 81 /2 id | ADC r/m32, imm32 | MI | Valid | Valid | Add with CF imm32 to r/m32. |
| REX.W + 81 /2 id | ADC r/m64, imm32 | MI | Valid | N.E. | Add with CF imm32 sign extended to 64-bits to r/m64. |
| 83 /2 ib | ADC r/m16, imm8 | MI | Valid | Valid | Add with CF sign-extended imm8 to r/m16. |
| 83 /2 ib | ADC r/m32, imm8 | MI | Valid | Valid | Add with CF sign-extended imm8 into r/m32. |
| REX.W + 83 /2 ib | ADC r/m64, imm8 | MI | Valid | N.E. | Add with CF sign-extended imm8 into r/m64. |
| 10 /r | ADC r/m8 ¹ , r8 ¹ | MR | Valid | Valid | Add with carry byte register to r/m8. |
| 11 /r | ADC r/m16, r16 | MR | Valid | Valid | Add with carry r16 to r/m16. |
| 11 /r | ADC r/m32, r32 | MR | Valid | Valid | Add with CF r32 to r/m32. |
| REX.W + 11 /r | ADC r/m64, r64 | MR | Valid | N.E. | Add with CF r64 to r/m64. |
| 12 /r | ADC r8 ¹ , r/m8 ¹ | RM | Valid | Valid | Add with carry r/m8 to byte register. |
| 13 /r | ADC r16, r/m16 | RM | Valid | Valid | Add with carry r/m16 to r16. |
| 13 /r | ADC r32, r/m32 | RM | Valid | Valid | Add with CF r/m32 to r32. |
| REX.W + 13 /r | ADC r64, r/m64 | RM | Valid | N.E. | Add with CF r/m64 to r64. |

NOTES:

1. With a REX prefix in 64-bit mode, attempts to access AH, BH, CH, or DH will instead access SPL, DIL, BPL, or SIL, respectively.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------------|---------------|-----------|-----------|
| RM | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |
| MR | ModRM:r/m (r, w) | ModRM:reg (r) | N/A | N/A |
| MI | ModRM:r/m (r, w) | imm8/16/32 | N/A | N/A |
| I | AL/AX/EAX/RAX | imm8/16/32 | N/A | N/A |

Description

Adds the destination operand (first operand), the source operand (second operand), and the carry (CF) flag and stores the result in the destination operand. The destination operand can be a register or a memory location; the source operand can be an immediate, a register, or a memory location. (However, two memory operands cannot be used in one instruction.) The state of the CF flag represents a carry from a previous addition. When an immediate value is used as an operand, it is sign-extended to the length of the destination operand format.

The ADC instruction does not distinguish between signed or unsigned operands. Instead, the processor evaluates the result for both data types and sets the OF and CF flags to indicate a carry in the signed or unsigned result, respectively. The SF flag indicates the sign of the signed result.

The ADC instruction is usually executed as part of a multibyte or multiword addition in which an ADD instruction is followed by an ADC instruction.

This instruction can be used with a LOCK prefix to allow the instruction to be executed atomically.

In 64-bit mode, the instruction's default operation size is 32 bits. Using a REX prefix in the form of REX.R permits access to additional registers (R8-R15). Using a REX prefix in the form of REX.W promotes operation to 64 bits. See the summary chart at the beginning of this section for encoding data and limits.

Operation

DEST := DEST + SRC + CF;

Intel C/C++ Compiler Intrinsic Equivalent

ADC extern unsigned char _addcarry_u8(unsigned char c_in, unsigned char src1, unsigned char src2, unsigned char *sum_out);

ADC extern unsigned char _addcarry_u16(unsigned char c_in, unsigned short src1, unsigned short src2, unsigned short *sum_out);

ADC extern unsigned char _addcarry_u32(unsigned char c_in, unsigned int src1, unsigned char int, unsigned int *sum_out);

ADC extern unsigned char _addcarry_u64(unsigned char c_in, unsigned __int64 src1, unsigned __int64 src2, unsigned __int64 *sum_out);

Flags Affected

The OF, SF, ZF, AF, CF, and PF flags are set according to the result.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If the destination is located in a non-writable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register is used to access memory and it contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |

#UD

If the LOCK prefix is used but the destination is not a memory operand.

ADCX—Unsigned Integer Addition of Two Operands With Carry Flag

| Opcode/ Instruction | Op/ En | 64/32bit Mode Support | CPUID Feature Flag | Description |
|---|-----------|-----------------------------|--------------------------|--|
| 66 0F 38 F6 /r ADCX r32, r/m32 | RM | V/V | ADX | Unsigned addition of r32 with CF, r/m32 to r32, writes CF. |
| 66 REX.w 0F 38 F6 /r ADCX r64, r/m64 | RM | V/N.E. | ADX | Unsigned addition of r64 with CF, r/m64 to r64, writes CF. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------------|---------------|-----------|-----------|
| RM | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |

Description

Performs an unsigned addition of the destination operand (first operand), the source operand (second operand) and the carry-flag (CF) and stores the result in the destination operand. The destination operand is a general-purpose register, whereas the source operand can be a general-purpose register or memory location. The state of CF can represent a carry from a previous addition. The instruction sets the CF flag with the carry generated by the unsigned addition of the operands.

The ADCX instruction is executed in the context of multi-precision addition, where we add a series of operands with a carry-chain. At the beginning of a chain of additions, we need to make sure the CF is in a desired initial state. Often, this initial state needs to be 0, which can be achieved with an instruction to zero the CF (e.g., XOR).

This instruction is supported in real mode and virtual-8086 mode. The operand size is always 32 bits if not in 64-bit mode.

In 64-bit mode, the default operation size is 32 bits. Using a REX Prefix in the form of REX.R permits access to additional registers (R8-15). Using REX Prefix in the form of REX.W promotes operation to 64 bits.

ADCX executes normally either inside or outside a transaction region.

Note: ADCX defines the OF flag differently than the ADD/ADC instructions as defined in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2A.

Operation

IF OperandSize is 64-bit

THEN CF:DEST[63:0] := DEST[63:0] + SRC[63:0] + CF;

ELSE CF:DEST[31:0] := DEST[31:0] + SRC[31:0] + CF;

FI;

Flags Affected

CF is updated based on result. OF, SF, ZF, AF, and PF flags are unmodified.

Intel C/C++ Compiler Intrinsic Equivalent

```
unsigned char _addcarryx_u32 (unsigned char c_in, unsigned int src1, unsigned int src2, unsigned int *sum_out);
```

```
unsigned char _addcarryx_u64 (unsigned char c_in, unsigned __int64 src1, unsigned __int64 src2, unsigned __int64 *sum_out);
```

SIMD Floating-Point Exceptions

None.

Protected Mode Exceptions

| | |
|-----------------|--|
| #UD | If the LOCK prefix is used. If CPUID.(EAX=07H, ECX=0H):EBX.ADX[bit 19] = 0. |
| #SS(0) | For an illegal address in the SS segment. |
| #GP(0) | For an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. If the DS, ES, FS, or GS register is used to access memory and it contains a null segment selector. |
| #PF(fault-code) | For a page fault. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |

Real-Address Mode Exceptions

| | |
|--------|--|
| #UD | If the LOCK prefix is used. If CPUID.(EAX=07H, ECX=0H):EBX.ADX[bit 19] = 0. |
| #SS(0) | For an illegal address in the SS segment. |

| 01 /r | ADD r/m32, r32 | MR | Valid | Valid | Add r32 to r/m32. |
| REX.W + 01 /r | ADD r/m64, r64 | MR | Valid | N.E. | Add r64 to r/m64. |
| 02 /r | ADD r8 ¹ , r/m8 ¹ | RM | Valid | Valid | Add r/m8 to r8. |
| 03 /r | ADD r16, r/m16 | RM | Valid | Valid | Add r/m16 to r16. |
| 03 /r | ADD r32, r/m32 | RM | Valid | Valid | Add r/m32 to r32. |
| REX.W + 03 /r | ADD r64, r/m64 | RM | Valid | N.E. | Add r/m64 to r64. |

NOTES:

1. With a REX prefix in 64-bit mode, attempts to access AH, BH, CH, or DH will instead access SPL, DIL, BPL, or SIL, respectively.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------------|---------------|-----------|-----------|
| RM | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |
| MR | ModRM:r/m (r, w) | ModRM:reg (r) | N/A | N/A |
| MI | ModRM:r/m (r, w) | imm8/16/32 | N/A | N/A |
| I | AL/AX/EAX/RAX | imm8/16/32 | N/A | N/A |

Description

Adds the destination operand (first operand) and the source operand (second operand) and then stores the result in the destination operand. The destination operand can be a register or a memory location; the source operand can be an immediate, a register, or a memory location. (However, two memory operands cannot be used in one instruction.) When an immediate value is used as an operand, it is sign-extended to the length of the destination operand format.

The ADD instruction performs integer addition. It evaluates the result for both signed and unsigned integer operands and sets the OF and CF flags to indicate a carry (overflow) in the signed or unsigned result, respectively. The SF flag indicates the sign of the signed result.

This instruction can be used with a LOCK prefix to allow the instruction to be executed atomically.

In 64-bit mode, the instruction's default operation size is 32 bits. Using a REX prefix in the form of REX.R permits access to additional registers (R8-R15). Using a REX prefix in the form of REX.W promotes operation to 64 bits. See the summary chart at the beginning of this section for encoding data and limits.

Operation

DEST := DEST + SRC;

Flags Affected

The OF, SF, ZF, AF, CF, and PF flags are set according to the result.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If the destination is located in a non-writable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register is used to access memory and it contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------|------------------|---------------|---------------|-----------|
| A | N/A | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |
| B | N/A | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | N/A |
| C | Full | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | N/A |

Description

Adds two, four or eight packed double precision floating-point values from the first source operand to the second source operand, and stores the packed double precision floating-point result in the destination operand.

EVEX encoded versions: The first source operand is a ZMM/YMM/XMM register. The second source operand can be a ZMM/YMM/XMM register, a 512/256/128-bit memory location or a 512/256/128-bit vector broadcasted from a 64-bit memory location. The destination operand is a ZMM/YMM/XMM register conditionally updated with write-mask k1.

VEX.256 encoded version: The first source operand is a YMM register. The second source operand can be a YMM register or a 256-bit memory location. The destination operand is a YMM register. The upper bits (MAXVL-1:256) of the corresponding ZMM register destination are zeroed.

VEX.128 encoded version: the first source operand is a XMM register. The second source operand is an XMM register or 128-bit memory location. The destination operand is an XMM register. The upper bits (MAXVL-1:128) of the corresponding ZMM register destination are zeroed.

128-bit Legacy SSE version: The second source can be an XMM register or an 128-bit memory location. The destination is not distinct from the first source XMM register and the upper Bits (MAXVL-1:128) of the corresponding ZMM register destination are unmodified.

Description

Adds four, eight or sixteen packed single precision floating-point values from the first source operand with the second source operand, and stores the packed single precision floating-point result in the destination operand.

EVEX encoded versions: The first source operand is a ZMM/YMM/XMM register. The second source operand can be a ZMM/YMM/XMM register, a 512/256/128-bit memory location or a 512/256/128-bit vector broadcasted from a 32-bit memory location. The destination operand is a ZMM/YMM/XMM register conditionally updated with write-mask k1.

VEX.256 encoded version: The first source operand is a YMM register. The second source operand can be a YMM register or a 256-bit memory location. The destination operand is a YMM register. The upper bits (MAXVL-1:256) of the corresponding ZMM register destination are zeroed.

VEX.128 encoded version: the first source operand is a XMM register. The second source operand is an XMM register or 128-bit memory location. The destination operand is an XMM register. The upper bits (MAXVL-1:128) of the corresponding ZMM register destination are zeroed.

128-bit Legacy SSE version: The second source can be an XMM register or an 128-bit memory location. The destination is not distinct from the first source XMM register and the upper Bits (MAXVL-1:128) of the corresponding ZMM register destination are unmodified.

ADDSD—Add Scalar Double Precision Floating-Point Values

| Opcode/ Instruction | Op / En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|--|------------|------------------------------|-----------------------|---|
| F2 0F 58 /r ADDSD xmm1, xmm2/m64 | A | V/V | SSE2 | Add the low double precision floating-point value from xmm2/mem to xmm1 and store the result in xmm1. |
| VEX.LIG.F2.0F.WIG 58 /r VADDSD xmm1, xmm2, xmm3/m64 | B | V/V | AVX | Add the low double precision floating-point value from xmm3/mem to xmm2 and store the result in xmm1. |
| EVEX.LLIG.F2.0F.W1 58 /r VADDSD xmm1 {k1}{z}, xmm2, xmm3/m64{er} | C | V/V | AVX512F OR AVX10.1 | Add the low double precision floating-point value from xmm3/m64 to xmm2 and store the result in xmm1 with writemask k1. |

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|------------------|---------------|---------------|-----------|
| A | N/A | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |
| B | N/A | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | N/A |
| C | Tuple1 Scalar | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | N/A |

Description

Adds the low double precision floating-point values from the second source operand and the first source operand and stores the double precision floating-point result in the destination operand.

The second source operand can be an XMM register or a 64-bit memory location. The first source and destination operands are XMM registers.

128-bit Legacy SSE version: The first source and destination operands are the same. Bits (MAXVL-1:64) of the corresponding destination register remain unchanged.

EVEX and VEX.128 encoded version: The first source operand is encoded by EVEX.vvvv/VEX.vvvv. Bits (127:64) of the XMM register destination are copied from corresponding bits in the first source operand. Bits (MAXVL-1:128) of the destination register are zeroed.

EVEX version: The low quadword element of the destination is updated according to the writemask.

Software should ensure VADDSD is encoded with VEX.L=0. Encoding VADDSD with VEX.L=1 may encounter unpredictable behavior across different processor generations.

ADDSS—Add Scalar Single Precision Floating-Point Values

| Opcode/ Instruction | Op / En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|---|------------|------------------------------|-----------------------|---|
| F3 0F 58 /r ADDSS xmm1, xmm2/m32 | A | V/V | SSE | Add the low single precision floating-point value from xmm2/mem to xmm1 and store the result in xmm1. |
| VEX.LIG.F3.0F.WIG 58 /r VADDSS xmm1, xmm2, xmm3/m32 | B | V/V | AVX | Add the low single precision floating-point value from xmm3/mem to xmm2 and store the result in xmm1. |
| EVEX.LLIG.F3.0F.W0 58 /r VADDSS xmm1{k1}{z}, xmm2, xmm3/m32{er} | C | V/V | AVX512F OR AVX10.1 | Add the low single precision floating-point value from xmm3/m32 to xmm2 and store the result in xmm1 with writemask k1. |

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|------------------|---------------|---------------|-----------|
| A | N/A | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |
| B | N/A | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | N/A |
| C | Tuple1 Scalar | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | N/A |

Description

Adds the low single precision floating-point values from the second source operand and the first source operand, and stores the double precision floating-point result in the destination operand.

The second source operand can be an XMM register or a 64-bit memory location. The first source and destination operands are XMM registers.

128-bit Legacy SSE version: The first source and destination operands are the same. Bits (MAXVL-1:32) of the corresponding the destination register remain unchanged.

EVEX and VEX.128 encoded version: The first source operand is encoded by EVEX.vvvv/VEX.vvvv. Bits (127:32) of the XMM register destination are copied from corresponding bits in the first source operand. Bits (MAXVL-1:128) of the destination register are zeroed.

EVEX version: The low doubleword element of the destination is updated according to the writemask.

Software should ensure VADDSS is encoded with VEX.L=0. Encoding VADDSS with VEX.L=1 may encounter unpredictable behavior across different processor generations.

Operation

ADDSUBPD—Packed Double Precision Floating-Point Add/Subtract

| Opcode/ Instruction | Op/ En | 64/32-bit Mode | CPUID Feature Flag | Description |
|--|-----------|-------------------|--------------------------|---|
| 66 0F D0 /r ADDSUBPD xmm1, xmm2/m128 | RM | V/V | SSE3 | Add/subtract double precision floating-point values from xmm2/m128 to xmm1. |
| VEX.128.66.0F.WIG D0 /r VADDSUBPD xmm1, xmm2, xmm3/m128 | RVM | V/V | AVX | Add/subtract packed double precision floating-point values from xmm3/mem to xmm2 and stores result in xmm1. |
| VEX.256.66.0F.WIG D0 /r VADDSUBPD ymm1, ymm2, ymm3/m256 | RVM | V/V | AVX | Add / subtract packed double precision floating-point values from ymm3/mem to ymm2 and stores result in ymm1. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------------|---------------|---------------|-----------|
| RM | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |
| RVM | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | N/A |

Description

Adds odd-numbered double precision floating-point values of the first source operand (second operand) with the corresponding double precision floating-point values from the second source operand (third operand); stores the result in the odd-numbered values of the destination operand (first operand). Subtracts the even-numbered double precision floating-point values from the second source operand from the corresponding double precision floating values in the first source operand; stores the result into the even-numbered values of the destination operand.

In 64-bit mode, using a REX prefix in the form of REX.R permits this instruction to access additional registers (XMM8-XMM15).

128-bit Legacy SSE version: The second source can be an XMM register or an 128-bit memory location. The destination is not distinct from the first source XMM register and the upper bits (MAXVL-1:128) of the corresponding YMM register destination are unmodified. See Figure 3-3.

VEX.128 encoded version: the first source operand is an XMM register or 128-bit memory location. The destination operand is an XMM register. The upper bits (MAXVL-1:128) of the corresponding YMM register destination are zeroed.

VEX.256 encoded version: The first source operand is a YMM register. The second source operand can be a YMM register or a 256-bit memory location. The destination operand is a YMM register.

Overflow, Underflow, Invalid, Precision, Denormal.

Other Exceptions

See Table 2-19, “Type 2 Class Exception Conditions.”

ADOX — Unsigned Integer Addition of Two Operands With Overflow Flag

| Opcode/ Instruction | Op/ En | 64/32bit Mode Support | CPUID Feature Flag | Description |
|---|-----------|-----------------------------|--------------------------|--|
| F3 0F 38 F6 /r ADOX r32, r/m32 | RM | V/V | ADX | Unsigned addition of r32 with OF, r/m32 to r32, writes OF. |
| F3 REX.w 0F 38 F6 /r ADOX r64, r/m64 | RM | V/N.E. | ADX | Unsigned addition of r64 with OF, r/m64 to r64, writes OF. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------------|---------------|-----------|-----------|
| RM | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |

Description

Performs an unsigned addition of the destination operand (first operand), the source operand (second operand) and the overflow-flag (OF) and stores the result in the destination operand. The destination operand is a general-purpose register, whereas the source operand can be a general-purpose register or memory location. The state of OF represents a carry from a previous addition. The instruction sets the OF flag with the carry generated by the unsigned addition of the operands.

The ADOX instruction is executed in the context of multi-precision addition, where we add a series of operands with a carry-chain. At the beginning of a chain of additions, we execute an instruction to zero the OF (e.g. XOR).

This instruction is supported in real mode and virtual-8086 mode. The operand size is always 32 bits if not in 64-bit mode.

In 64-bit mode, the default operation size is 32 bits. Using a REX Prefix in the form of REX.R permits access to additional registers (R8-15). Using REX Prefix in the form of REX.W promotes operation to 64-bits.

ADOX executes normally either inside or outside a transaction region.

Note: ADOX defines the CF and OF flags differently than the ADD/ADC instructions as defined in Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2A.

Operation

```
IF OperandSize is 64-bit
  THEN OF:DEST[63:0] := DEST[63:0] + SRC[63:0] + OF;
  ELSE OF:DEST[31:0] := DEST[31:0] + SRC[31:0] + OF;
FI;
```

Flags Affected

OF is updated based on result. CF, SF, ZF, AF, and PF flags are unmodified.

Intel C/C++ Compiler Intrinsic Equivalent

```
unsigned char _addcarryx_u32 (unsigned char c_in, unsigned int src1, unsigned int src2, unsigned int *sum_out);
unsigned char _addcarryx_u64 (unsigned char c_in, unsigned __int64 src1, unsigned __int64 src2, unsigned __int64 *sum_out);
```

Instruction Operand Encoding

| Op/En | Tuple | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|----------|------------------|---------------|---------------|-----------|
| A | N/A | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |
| B | N/A | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | N/A |
| C | Full Mem | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | N/A |

Description

This instruction performs a single round of the AES decryption flow using the Equivalent Inverse Cipher, using one/two/four (depending on vector length) 128-bit data (state) from the first source operand with one/two/four (depending on vector length) round key(s) from the second source operand, and stores the result in the destination operand.

Use the AESDEC instruction for all but the last decryption round. For the last decryption round, use the AESDECLAST instruction.

VEX and EVEX encoded versions of the instruction allow 3-operand (non-destructive) operation. The legacy encoded versions of the instruction require that the first source operand and the destination operand are the same and must be an XMM register.

The EVEX encoded form of this instruction does not support memory fault suppression.

Operation

AESDEC

```
STATE := SRC1;  
RoundKey := SRC2;  
STATE := InvShiftRows( STATE );  
STATE := InvSubBytes( STATE );  
STATE := InvMixColumns( STATE );  
DEST[127:0] := STATE XOR RoundKey;

| A | N/A | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |

Description

The AESDEC128KL¹ instruction performs 10 rounds of AES to decrypt the first operand using the 128-bit key indicated by the handle from the second operand. It stores the result in the first operand if the operation succeeds (e.g., does not run into a handle violation failure).

Operation

AESDEC128KL

```
Handle := UnalignedLoad of 384 bit (SRC);    // Load is not guaranteed to be atomic.
Illegal Handle = (HandleReservedBitSet (Handle) ||
    (Handle[0] AND (CPL > 0)) ||
    Handle [2] ||
    HandleKeyType (Handle) != HANDLE_KEY_TYPE_AES128);
IF (Illegal Handle) {
    THEN RFLAGS.ZF := 1;
    ELSE
        (UnwrappedKey, Authentic) := UnwrapKeyAndAuthenticate384 (Handle[383:0], lWKey);
        IF (Authentic == 0)
            THEN RFLAGS.ZF := 1;
            ELSE
                DEST := AES128Decrypt (DEST, UnwrappedKey);
                RFLAGS.ZF := 0;
        FI;
    FI;
RFLAGS.OF, SF, AF, PF, CF := 0;
```

Flags Affected

ZF is set to 0 if the operation succeeded and set to 1 if the operation failed due to a handle violation. The other arithmetic flags (OF, SF, AF, PF, CF) are cleared to 0.

Intel C/C++ Compiler Intrinsic Equivalent

```
AESDEC128KL    unsigned char _mm_aesdec128kl_u8(__m128i* odata, __m128i idata, const void* h);
```

AESDECWIDE128KL—Perform Ten Rounds of AES Decryption Flow With Key Locker on 8 Blocks Using 128-Bit Key

| Opcode/ Instruction | Op/ En | 64/32-bit Mode | CPUID Feature Flag | Description |
|---|-----------|-------------------|-----------------------|---|
| F3 0F 38 D8 !{11}:001:bbb AESDECWIDE128KL m384, <XMM0-7> | A | V/V | AESKLEWIDE_KL | Decrypt XMM0-7 using 128-bit AES key indicated by handle at m384 and store each resultant block back to its corresponding register. |

Instruction Operand Encoding

| Op/En | Tuple | Operand 1 | Operands 2—9 |
|-------|-------|---------------|------------------------|
| A | N/A | ModRM:r/m (r) | Implicit XMM0-7 (r, w) |

Description

The AESDECWIDE128KL¹ instruction performs ten rounds of AES to decrypt each of the eight blocks in XMM0-7 using the 128-bit key indicated by the handle from the second operand. It replaces each input block in XMM0-7 with its corresponding decrypted block if the operation succeeds (e.g., does not run into a handle violation failure).

Operation

AESDECWIDE128KL

```

Handle := UnalignedLoad of 384 bit (SRC);    // Load is not guaranteed to be atomic.
Illegal Handle = (HandleReservedBitSet (Handle) ||
    (Handle[0] AND (CPL > 0)) ||
    Handle [2] ||
    HandleKeyType (Handle) != HANDLE_KEY_TYPE_AES128);
IF (Illegal Handle)
    THEN RFLAGS.ZF := 1;
ELSE
    (UnwrappedKey, Authentic) := UnwrapKeyAndAuthenticate384 (Handle[383:0], lWKey);
    IF Authentic == 0 {
        THEN RFLAGS.ZF := 1;
        ELSE
            XMM0 := AES128Decrypt (XMM0, UnwrappedKey);
            XMM1 := AES128Decrypt (XMM1, UnwrappedKey);

|-------|----------|------------------|---------------|---------------|-----------|
| A | N/A | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |
| B | N/A | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | N/A |
| C | Full Mem | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | N/A |

Description

This instruction performs a single round of an AES encryption flow using one/two/four (depending on vector length) 128-bit data (state) from the first source operand with one/two/four (depending on vector length) round key(s) from the second source operand, and stores the result in the destination operand.

Use the AESENC instruction for all but the last encryption rounds. For the last encryption round, use the AESENC-CLAST instruction.

VEX and EVEX encoded versions of the instruction allow 3-operand (non-destructive) operation. The legacy encoded versions of the instruction require that the first source operand and the destination operand are the same and must be an XMM register.

The EVEX encoded form of this instruction does not support memory fault suppression.

Operation

AESENC

```
STATE := SRC1;
RoundKey := SRC2;
STATE := ShiftRows( STATE );
STATE := SubBytes( STATE );
STATE := MixColumns( STATE );
DEST[127:0] := STATE XOR RoundKey;

| A | N/A | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |

Description

The AESENC128KL¹ instruction performs ten rounds of AES to encrypt the first operand using the 128-bit key indicated by the handle from the second operand. It stores the result in the first operand if the operation succeeds (e.g., does not run into a handle violation failure).

Operation

AESENC128KL

```

Handle := UnalignedLoad of 384 bit (SRC);    // Load is not guaranteed to be atomic.
Illegal Handle = (
    HandleReservedBitSet (Handle) ||
    (Handle[0] AND (CPL > 0)) ||
    Handle [1] ||
    HandleKeyType (Handle) != HANDLE_KEY_TYPE_AES128
);
IF (Illegal Handle) {
    THEN RFLAGS.ZF := 1;
    ELSE
        (UnwrappedKey, Authentic) := UnwrapKeyAndAuthenticate384 (Handle[383:0], lWKey);
        IF (Authentic == 0)
            THEN RFLAGS.ZF := 1;
        ELSE
            DEST := AES128Encrypt (DEST, UnwrappedKey);
            RFLAGS.ZF := 0;
        FI;
    FI;
    RFLAGS.OF, SF, AF, PF, CF := 0;

```

Flags Affected

ZF is set to 0 if the operation succeeded and set to 1 if the operation failed due to a handle violation. The other arithmetic flags (OF, SF, AF, PF, CF) are cleared to 0.

Intel C/C++ Compiler Intrinsic Equivalent

```
AESENC128KL unsigned char _mm_aesenc128kl_u8(__m128i* odata, __m128i idata, const void* h);
```

| C | Full Mem | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | N/A |

Description

This instruction performs the last round of an AES encryption flow using one/two/four (depending on vector length) 128-bit data (state) from the first source operand with one/two/four (depending on vector length) round key(s) from the second source operand, and stores the result in the destination operand.

VEX and EVEX encoded versions of the instruction allows 3-operand (non-destructive) operation. The legacy encoded versions of the instruction require that the first source operand and the destination operand are the same and must be an XMM register.

The EVEX encoded form of this instruction does not support memory fault suppression.

Operation

AESENCLAST

```
STATE := SRC1;
RoundKey := SRC2;
STATE := ShiftRows( STATE );
STATE := SubBytes( STATE );
DEST[127:0] := STATE XOR RoundKey;
DEST[MAXVL-1:128] (Unmodified)
```

AESIMC—Perform the AES InvMixColumn Transformation

| Opcode/ Instruction | Op/ En | 64/32-bit Mode | CPUID Feature Flag | Description |
|--|-----------|-------------------|------------------------------|---|
| 66 0F 38 DB /r AESIMC xmm1, xmm2/m128 | RM | V/V | AES | Perform the InvMixColumn transformation on a 128-bit round key from xmm2/m128 and store the result in xmm1. |
| VEX.128.66.0F38.WIG DB /r VAESIMC xmm1, xmm2/m128 | RM | V/V | Both AES and AVX flags | Perform the InvMixColumn transformation on a 128-bit round key from xmm2/m128 and store the result in xmm1. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|-----------|-----------|
| RM | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Perform the InvMixColumns transformation on the source operand and store the result in the destination operand. The destination operand is an XMM register. The source operand can be an XMM register or a 128-bit memory location.

Note: the AESIMC instruction should be applied to the expanded AES round keys (except for the first and last round key) in order to prepare them for decryption using the “Equivalent Inverse Cipher” (defined in FIPS 197).

128-bit Legacy SSE version: Bits (MAXVL-1:128) of the corresponding YMM destination register remain unchanged.

VEX.128 encoded version: Bits (MAXVL-1:128) of the destination YMM register are zeroed.

Note: In VEX-encoded versions, VEX.vvvv is reserved and must be 1111b, otherwise instructions will #UD.

Operation

AESIMC

```
DEST[127:0] := InvMixColumns( SRC );
DEST[MAXVL-1:128] (Unmodified)
```

VAESIMC

```
DEST[127:0] := InvMixColumns( SRC );

NOTES:

1. With a REX prefix in 64-bit mode, attempts to access AH, BH, CH, or DH will instead access SPL, DIL, BPL, or SIL, respectively.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------------|---------------|-----------|-----------|
| RM | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |
| MR | ModRM:r/m (r, w) | ModRM:reg (r) | N/A | N/A |
| MI | ModRM:r/m (r, w) | imm8/16/32 | N/A | N/A |
| I | AL/AX/EAX/RAX | imm8/16/32 | N/A | N/A |

Description

Performs a bitwise AND operation on the destination (first) and source (second) operands and stores the result in the destination operand location. The source operand can be an immediate, a register, or a memory location; the destination operand can be a register or a memory location. (However, two memory operands cannot be used in one instruction.) Each bit of the result is set to 1 if both corresponding bits of the first and second operands are 1; otherwise, it is set to 0.

This instruction can be used with a LOCK prefix to allow the it to be executed atomically.

In 64-bit mode, the instruction's default operation size is 32 bits. Using a REX prefix in the form of REX.R permits access to additional registers (R8-R15). Using a REX prefix in the form of REX.W promotes operation to 64 bits. See the summary chart at the beginning of this section for encoding data and limits.

Operation

DEST := DEST AND SRC;

Flags Affected

The OF and CF flags are cleared; the SF, ZF, and PF flags are set according to the result. The state of the AF flag is undefined.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If the destination operand points to a non-writable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

ANDN—Logical AND NOT

| Opcode/Instruction | Op/En | 64/32-bit Mode | CPUID Feature Flag | Description |
|--|-------|----------------|--------------------|--|
| VEX.LZ.0F38.W0 F2 /r ANDN r32a, r32b, r/m32 | RVM | V/V | BMI1 | Bitwise AND of inverted r32b with r/m32, store result in r32a. |
| VEX.LZ.0F38.W1 F2 /r ANDN r64a, r64b, r/m64 | RVM | V/N.E. | BMI1 | Bitwise AND of inverted r64b with r/m64, store result in r64a. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|--------------|---------------|-----------|
| RVM | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | N/A |

Description

Performs a bitwise logical AND of inverted second operand (the first source operand) with the third operand (the second source operand). The result is stored in the first operand (destination operand).

This instruction is not supported in real mode and virtual-8086 mode. The operand size is always 32 bits if not in 64-bit mode. In 64-bit mode operand size 64 requires VEX.W1. VEX.W1 is ignored in non-64-bit modes. An attempt to execute this instruction with VEX.L not equal to 0 will cause #UD.

Operation

DEST := (NOT SRC1) bitwiseAND SRC2;

SF := DEST[OperandSize - 1];

ZF := (DEST = 0);

Flags Affected

SF and ZF are updated based on result. OF and CF flags are cleared. AF and PF flags are undefined.

Intel C/C++ Compiler Intrinsic Equivalent

Auto-generated from high-level language.

SIMD Floating-Point Exceptions

None.

Other Exceptions

See Table 2-29, "Type 13 Class Exception Conditions."

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------|------------------|---------------|---------------|-----------|
| A | N/A | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |
| B | N/A | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | N/A |
| C | Full | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | N/A |

Description

Performs a bitwise logical AND NOT of the two, four or eight packed double precision floating-point values from the first source operand and the second source operand, and stores the result in the destination operand.

EVEX encoded versions: The first source operand is a ZMM/YMM/XMM register. The second source operand can be a ZMM/YMM/XMM register, a 512/256/128-bit memory location, or a 512/256/128-bit vector broadcasted from a 64-bit memory location. The destination operand is a ZMM/YMM/XMM register conditionally updated with write-mask k1.

VEX.256 encoded version: The first source operand is a YMM register. The second source operand is a YMM register or a 256-bit memory location. The destination operand is a YMM register. The upper bits (MAXVL-1:256) of the corresponding ZMM register destination are zeroed.

VEX.128 encoded version: The first source operand is an XMM register. The second source operand is an XMM register or 128-bit memory location. The destination operand is an XMM register. The upper bits (MAXVL-1:128) of the corresponding ZMM register destination are zeroed.

128-bit Legacy SSE version: The second source can be an XMM register or an 128-bit memory location. The destination is not distinct from the first source XMM register and the upper bits (MAXVL-1:128) of the corresponding register destination are unmodified.

Description

Performs a bitwise logical AND NOT of the four, eight or sixteen packed single precision floating-point values from the first source operand and the second source operand, and stores the result in the destination operand.

EVEX encoded versions: The first source operand is a ZMM/YMM/XMM register. The second source operand can be a ZMM/YMM/XMM register, a 512/256/128-bit memory location, or a 512/256/128-bit vector broadcasted from a 32-bit memory location. The destination operand is a ZMM/YMM/XMM register conditionally updated with write-mask k1.

VEX.256 encoded version: The first source operand is a YMM register. The second source operand is a YMM register or a 256-bit memory location. The destination operand is a YMM register. The upper bits (MAXVL-1:256) of the corresponding ZMM register destination are zeroed.

VEX.128 encoded version: The first source operand is an XMM register. The second source operand is an XMM register or 128-bit memory location. The destination operand is an XMM register. The upper bits (MAXVL-1:128) of the corresponding ZMM register destination are zeroed.

128-bit Legacy SSE version: The second source can be an XMM register or an 128-bit memory location. The destination is not distinct from the first source XMM register and the upper bits (MAXVL-1:128) of the corresponding ZMM register destination are unmodified.

Description

Performs a bitwise logical AND of the two, four or eight packed double precision floating-point values from the first source operand and the second source operand, and stores the result in the destination operand.

EVEX encoded versions: The first source operand is a ZMM/YMM/XMM register. The second source operand can be a ZMM/YMM/XMM register, a 512/256/128-bit memory location, or a 512/256/128-bit vector broadcasted from a 64-bit memory location. The destination operand is a ZMM/YMM/XMM register conditionally updated with write-mask k1.

VEX.256 encoded version: The first source operand is a YMM register. The second source operand is a YMM register or a 256-bit memory location. The destination operand is a YMM register. The upper bits (MAXVL-1:256) of the corresponding ZMM register destination are zeroed.

VEX.128 encoded version: The first source operand is an XMM register. The second source operand is an XMM register or 128-bit memory location. The destination operand is an XMM register. The upper bits (MAXVL-1:128) of the corresponding ZMM register destination are zeroed.

128-bit Legacy SSE version: The second source can be an XMM register or an 128-bit memory location. The destination is not distinct from the first source XMM register and the upper bits (MAXVL-1:128) of the corresponding register destination are unmodified.

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------|------------------|---------------|---------------|-----------|
| A | N/A | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |
| B | N/A | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | N/A |
| C | Full | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | N/A |

Description

Performs a bitwise logical AND of the four, eight or sixteen packed single precision floating-point values from the first source operand and the second source operand, and stores the result in the destination operand.

EVEX encoded versions: The first source operand is a ZMM/YMM/XMM register. The second source operand can be a ZMM/YMM/XMM register, a 512/256/128-bit memory location, or a 512/256/128-bit vector broadcasted from a 32-bit memory location. The destination operand is a ZMM/YMM/XMM register conditionally updated with write-mask k1.

VEX.256 encoded version: The first source operand is a YMM register. The second source operand is a YMM register or a 256-bit memory location. The destination operand is a YMM register. The upper bits (MAXVL-1:256) of the corresponding ZMM register destination are zeroed.

VEX.128 encoded version: The first source operand is an XMM register. The second source operand is an XMM register or 128-bit memory location. The destination operand is an XMM register. The upper bits (MAXVL-1:128) of the corresponding ZMM register destination are zeroed.

128-bit Legacy SSE version: The second source can be an XMM register or an 128-bit memory location. The destination is not distinct from the first source XMM register and the upper bits (MAXVL-1:128) of the corresponding ZMM register destination are unmodified.

ARPL—Adjust RPL Field of Segment Selector

| Opcode | Instruction | Op/En | 64-bit Mode | Compat/Leg Mode | Description |
|--------|-----------------|-------|-------------|-----------------|--|
| 63 /r | ARPL r/m16, r16 | MR | N. E. | Valid | Adjust RPL of r/m16 to not less than RPL of r16. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|-----------|-----------|
| MR | ModRM:r/m (w) | ModRM:reg (r) | N/A | N/A |

Description

Compares the RPL fields of two segment selectors. The first operand (the destination operand) contains one segment selector and the second operand (source operand) contains the other. (The RPL field is located in bits 0 and 1 of each operand.) If the RPL field of the destination operand is less than the RPL field of the source operand, the ZF flag is set and the RPL field of the destination operand is increased to match that of the source operand. Otherwise, the ZF flag is cleared and no change is made to the destination operand. (The destination operand can be a word register or a memory location; the source operand must be a word register.)

The ARPL instruction is provided for use by operating-system procedures (however, it can also be used by applications). It is generally used to adjust the RPL of a segment selector that has been passed to the operating system by an application program to match the privilege level of the application program. Here the segment selector passed to the operating system is placed in the destination operand and segment selector for the application program's code segment is placed in the source operand. (The RPL field in the source operand represents the privilege level of the application program.) Execution of the ARPL instruction then ensures that the RPL of the segment selector received by the operating system is no lower (does not have a higher privilege) than the privilege level of the application program (the segment selector for the application program's code segment can be read from the stack following a procedure call).

This instruction executes as described in compatibility mode and legacy mode. It is not encodable in 64-bit mode.

See "Checking Caller Access Privileges" in Chapter 3, "Protected-Mode Memory Management," of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A, for more information about the use of this instruction.

Operation

IF 64-BIT MODE

THEN

See MOVSLD;

ELSE

IF DEST[RPL] < SRC[RPL]

THEN

ZF := 1;

DEST[RPL] := SRC[RPL];

ELSE

ZF := 0;

FI;

FI;

Flags Affected

The ZF flag is set to 1 if the RPL field of the destination operand is less than that of the source operand; otherwise, it is set to 0.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If the destination is located in a non-writable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register is used to access memory and it contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #UD | The ARPL instruction is not recognized in real-address mode. If the LOCK prefix is used. |
|-----|---|

Virtual-8086 Mode Exceptions

| | |
|-----|---|
| #UD | The ARPL instruction is not recognized in virtual-8086 mode. If the LOCK prefix is used. |
|-----|---|

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

Not applicable.

BEXTR—Bit Field Extract

| Opcode/Instruction | Op/En | 64/32-bit Mode | CPUID Feature Flag | Description |
|---|-------|----------------|--------------------|--|
| VEX.LZ.OF38.W0 F7 /r BEXTR r32a, r/m32, r32b | RMV | V/V | BMI1 | Contiguous bitwise extract from r/m32 using r32b as control; store result in r32a. |
| VEX.LZ.OF38.W1 F7 /r BEXTR r64a, r/m64, r64b | RMV | V/N.E. | BMI1 | Contiguous bitwise extract from r/m64 using r64b as control; store result in r64a. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|--------------|-----------|
| RMV | ModRM:reg (w) | ModRM:r/m (r) | VEX.vvvv (r) | N/A |

Description

Extracts contiguous bits from the first source operand (the second operand) using an index value and length value specified in the second source operand (the third operand). Bit 7:0 of the second source operand specifies the starting bit position of bit extraction. A START value exceeding the operand size will not extract any bits from the second source operand. Bit 15:8 of the second source operand specifies the maximum number of bits (LENGTH) beginning at the START position to extract. Only bit positions up to (OperandSize - 1) of the first source operand are extracted. The extracted bits are written to the destination register, starting from the least significant bit. All higher order bits in the destination operand (starting at bit position LENGTH) are zeroed. The destination register is cleared if no bits are extracted.

This instruction is not supported in real mode and virtual-8086 mode. The operand size is always 32 bits if not in 64-bit mode. In 64-bit mode operand size 64 requires VEX.W1. VEX.W1 is ignored in non-64-bit modes. An attempt to execute this instruction with VEX.L not equal to 0 will cause #UD.

Operation

```
START := SRC2[7:0];  
LEN := SRC2[15:8];  
TEMP := ZERO_EXTEND_TO_512 (SRC1 );  
DEST := ZERO_EXTEND(TEMP[START+LEN -1: START]);  
ZF := (DEST = 0);
```

Flags Affected

ZF is updated based on the result. AF, SF, and PF are undefined. All other flags are cleared.

Intel C/C++ Compiler Intrinsic Equivalent

```
BEXTR unsigned __int32 _bextr_u32(unsigned __int32 src, unsigned __int32 start, unsigned __int32 len);  
BEXTR unsigned __int64 _bextr_u64(unsigned __int64 src, unsigned __int32 start, unsigned __int32 len);
```

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------------|---------------|---------------|-----------|
| RMI | ModRM:reg (r, w) | ModRM:r/m (r) | imm8 | N/A |
| RVMI | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | imm8[3:0] |

Description

Double precision floating-point values from the second source operand (third operand) are conditionally merged with values from the first source operand (second operand) and written to the destination operand (first operand). The immediate bits [3:0] determine whether the corresponding double precision floating-point value in the destination is copied from the second source or first source. If a bit in the mask, corresponding to a word, is "1", then the double precision floating-point value in the second source operand is copied, else the value in the first source operand is copied.

128-bit Legacy SSE version: The second source can be an XMM register or an 128-bit memory location. The destination is not distinct from the first source XMM register and the upper bits (MAXVL-1:128) of the corresponding YMM register destination are unmodified.

VEX.128 encoded version: the first source operand is an XMM register. The second source operand is an XMM register or 128-bit memory location. The destination operand is an XMM register. The upper bits (MAXVL-1:128) of the corresponding YMM register destination are zeroed.

VEX.256 encoded version: The first source operand is a YMM register. The second source operand can be a YMM register or a 256-bit memory location. The destination operand is a YMM register.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------------|---------------|---------------|-----------|
| RMO | ModRM:reg (r, w) | ModRM:r/m (r) | implicit XMM0 | N/A |
| RVMR | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | imm8[7:4] |

Description

Conditionally copy each quadword data element of double precision floating-point value from the second source operand and the first source operand depending on mask bits defined in the mask register operand. The mask bits are the most significant bit in each quadword element of the mask register.

Each quadword element of the destination operand is copied from:

- the corresponding quadword element in the second source operand, if a mask bit is “1”; or
- the corresponding quadword element in the first source operand, if a mask bit is “0”

The register assignment of the implicit mask operand for BLENDVPD is defined to be the architectural register XMM0.

128-bit Legacy SSE version: The first source operand and the destination operand is the same. Bits (MAXVL-1:128) of the corresponding YMM destination register remain unchanged. The mask register operand is implicitly defined to be the architectural register XMM0. An attempt to execute BLENDVPD with a VEX prefix will cause #UD.

VEX.128 encoded version: The first source operand and the destination operand are XMM registers. The second source operand is an XMM register or 128-bit memory location. The mask operand is the third source register, and encoded in bits[7:4] of the immediate byte(imm8). The bits[3:0] of imm8 are ignored. In 32-bit mode, imm8[7] is ignored. The upper bits (MAXVL-1:128) of the corresponding YMM register (destination register) are zeroed.

VEX.W must be 0, otherwise, the instruction will #UD.

VEX.256 encoded version: The first source operand and destination operand are YMM registers. The second source operand can be a YMM register or a 256-bit memory location. The mask operand is the third source register, and encoded in bits[7:4] of the immediate byte(imm8). The bits[3:0] of imm8 are ignored. In 32-bit mode, imm8[7] is ignored. VEX.W must be 0, otherwise, the instruction will #UD.

VBLENDVPD permits the mask to be any XMM or YMM register. In contrast, BLENDVPD treats XMM0 implicitly as the mask and do not support non-destructive destination operation.

Operation

BLENDVPD (128-bit Legacy SSE Version)

```
MASK := XMM0
IF (MASK[63] = 0) THEN DEST[63:0] := DEST[63:0]

| VEX.256.66.0F3A.W0 4A /r /is4 VBLENDVPS ymm1, ymm2, ymm3/m256, ymm4 | RVMR | V/V | AVX | Conditionally copy single precision floating-point values from ymm2 or ymm3/m256 to ymm1, based on mask bits in the specified mask register, ymm4. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------------|---------------|---------------|-----------|
| RMO | ModRM:reg (r, w) | ModRM:r/m (r) | implicit XMM0 | N/A |
| RVMR | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | imm8[7:4] |

Description

Conditionally copy each dword data element of single precision floating-point value from the second source operand and the first source operand depending on mask bits defined in the mask register operand. The mask bits are the most significant bit in each dword element of the mask register.

Each quadword element of the destination operand is copied from:

- the corresponding dword element in the second source operand, if a mask bit is “1”; or
- the corresponding dword element in the first source operand, if a mask bit is “0”.

The register assignment of the implicit mask operand for BLENDVPS is defined to be the architectural register XMM0.

128-bit Legacy SSE version: The first source operand and the destination operand is the same. Bits (MAXVL-1:128) of the corresponding YMM destination register remain unchanged. The mask register operand is implicitly defined to be the architectural register XMM0. An attempt to execute BLENDVPS with a VEX prefix will cause #UD.

VEX.128 encoded version: The first source operand and the destination operand are XMM registers. The second source operand is an XMM register or 128-bit memory location. The mask operand is the third source register, and encoded in bits[7:4] of the immediate byte(imm8). The bits[3:0] of imm8 are ignored. In 32-bit mode, imm8[7] is ignored. The upper bits (MAXVL-1:128) of the corresponding YMM register (destination register) are zeroed.

VEX.W must be 0, otherwise, the instruction will #UD.

VEX.256 encoded version: The first source operand and destination operand are YMM registers. The second source operand can be a YMM register or a 256-bit memory location. The mask operand is the third source register, and encoded in bits[7:4] of the immediate byte(imm8). The bits[3:0] of imm8 are ignored. In 32-bit mode, imm8[7] is ignored. VEX.W must be 0, otherwise, the instruction will #UD.

VBLENDVPS permits the mask to be any XMM or YMM register. In contrast, BLENDVPS treats XMM0 implicitly as the mask and do not support non-destructive destination operation.

Operation

BLENDVPS (128-bit Legacy SSE Version)

```
MASK := XMM0

#UD If VEX.W = 1.

BLSI—Extract Lowest Set Isolated Bit

| Opcode/Instruction | Op/En | 64/32-bit Mode | CPUID Feature Flag | Description |
|---|-------|----------------|--------------------|---|
| VEX.LZ.OF38.W0 F3 /3 BLSI r32, r/m32 | VM | V/V | BMI1 | Extract lowest set bit from r/m32 and set that bit in r32. |
| VEX.LZ.OF38.W1 F3 /3 BLSI r64, r/m64 | VM | V/N.E. | BMI1 | Extract lowest set bit from r/m64, and set that bit in r64. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|--------------|---------------|-----------|-----------|
| VM | VEX.vvvv (w) | ModRM:r/m (r) | N/A | N/A |

Description

Extracts the lowest set bit from the source operand and set the corresponding bit in the destination register. All other bits in the destination operand are zeroed. If no bits are set in the source operand, BLSI sets all the bits in the destination to 0 and sets ZF and CF.

This instruction is not supported in real mode and virtual-8086 mode. The operand size is always 32 bits if not in 64-bit mode. In 64-bit mode operand size 64 requires VEX.W1. VEX.W1 is ignored in non-64-bit modes. An attempt to execute this instruction with VEX.L not equal to 0 will cause #UD.

Operation

```
temp := (-SRC) bitwiseAND (SRC);
SF := temp[OperandSize - 1];
ZF := (temp = 0);
IF SRC = 0
    CF := 0;
ELSE
    CF := 1;
FI
DEST := temp;
```

Flags Affected

ZF and SF are updated based on the result. CF is set if the source is not zero. OF flags are cleared. AF and PF flags are undefined.

Intel C/C++ Compiler Intrinsic Equivalent

```
BLSI unsigned __int32 _bsl_u32(unsigned __int32 src);
BLSI unsigned __int64 _bsl_u64(unsigned __int64 src);
```

SIMD Floating-Point Exceptions

None.

Other Exceptions

See Table 2-29, "Type 13 Class Exception Conditions."

BLSMSK—Get Mask Up to Lowest Set Bit

| Opcode/Instruction | Op/En | 64/32-bit Mode | CPUID Feature Flag | Description |
|---|-------|----------------|--------------------|--|
| VEX.LZ.OF38.W0 F3 /2 BLSMSK r32, r/m32 | VM | V/V | BMI1 | Set all lower bits in r32 to “1” starting from bit 0 to lowest set bit in r/m32. |
| VEX.LZ.OF38.W1 F3 /2 BLSMSK r64, r/m64 | VM | V/N.E. | BMI1 | Set all lower bits in r64 to “1” starting from bit 0 to lowest set bit in r/m64. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|--------------|---------------|-----------|-----------|
| VM | VEX.vvvv (w) | ModRM:r/m (r) | N/A | N/A |

Description

Sets all the lower bits of the destination operand to “1” up to and including lowest set bit (=1) in the source operand. If source operand is zero, BLSMSK sets all bits of the destination operand to 1 and also sets CF to 1.

This instruction is not supported in real mode and virtual-8086 mode. The operand size is always 32 bits if not in 64-bit mode. In 64-bit mode operand size 64 requires VEX.W1. VEX.W1 is ignored in non-64-bit modes. An attempt to execute this instruction with VEX.L not equal to 0 will cause #UD.

Operation

```
temp := (SRC-1) XOR (SRC);  
SF := temp[OperandSize - 1];  
ZF := 0;  
IF SRC = 0  
    CF := 1;  
ELSE  
    CF := 0;  
FI  
DEST := temp;
```

Flags Affected

SF is updated based on the result. CF is set if the source if zero. ZF and OF flags are cleared. AF and PF flag are undefined.

Intel C/C++ Compiler Intrinsic Equivalent

```
BLSMSK unsigned __int32 _blsmask_u32(unsigned __int32 src);

BLSR—Reset Lowest Set Bit

| Opcode/Instruction | Op/En | 64/32-bit Mode | CPUID Feature Flag | Description |
|---|-------|----------------|--------------------|--|
| VEX.LZ.OF38.W0 F3 /1 BLSR r32, r/m32 | VM | V/V | BMI1 | Reset lowest set bit of r/m32, keep all other bits of r/m32 and write result to r32. |
| VEX.LZ.OF38.W1 F3 /1 BLSR r64, r/m64 | VM | V/N.E. | BMI1 | Reset lowest set bit of r/m64, keep all other bits of r/m64 and write result to r64. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|--------------|---------------|-----------|-----------|
| VM | VEX.vvvv (w) | ModRM:r/m (r) | N/A | N/A |

Description

Copies all bits from the source operand to the destination operand and resets (=0) the bit position in the destination operand that corresponds to the lowest set bit of the source operand. If the source operand is zero BLSR sets CF.

This instruction is not supported in real mode and virtual-8086 mode. The operand size is always 32 bits if not in 64-bit mode. In 64-bit mode operand size 64 requires VEX.W1. VEX.W1 is ignored in non-64-bit modes. An attempt to execute this instruction with VEX.L not equal to 0 will cause #UD.

Operation

```
temp := (SRC-1) bitwiseAND ( SRC );  
SF := temp[OperandSize -1];  
ZF := (temp = 0);  
IF SRC = 0  
    CF := 1;  
ELSE  
    CF := 0;  
FI  
DEST := temp;
```

Flags Affected

ZF and SF flags are updated based on the result. CF is set if the source is zero. OF flag is cleared. AF and PF flags are undefined.

Intel C/C++ Compiler Intrinsic Equivalent

```
BLSR unsigned __int32 _blsr_u32(unsigned __int32 src);  
BLSR unsigned __int64 _blsr_u64(unsigned __int64 src);
```

BNDU/BNDN—Check Upper Bound

| Opcode/ Instruction | Op/En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|--------------------------------|-------|------------------------------|--------------------------|--|
| F2 OF 1A /r BNDU bnd, r/m32 | RM | N.E./V | MPX | Generate a #BR if the address in r/m32 is higher than the upper bound in bnd.UB (bnb.UB in 1's complement form). |
| F2 OF 1A /r BNDU bnd, r/m64 | RM | V/N.E. | MPX | Generate a #BR if the address in r/m64 is higher than the upper bound in bnd.UB (bnb.UB in 1's complement form). |
| F2 OF 1B /r BNDN bnd, r/m32 | RM | N.E./V | MPX | Generate a #BR if the address in r/m32 is higher than the upper bound in bnd.UB (bnb.UB not in 1's complement form). |
| F2 OF 1B /r BNDN bnd, r/m64 | RM | V/N.E. | MPX | Generate a #BR if the address in r/m64 is higher than the upper bound in bnd.UB (bnb.UB not in 1's complement form). |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 |
|-------|---------------|---------------|-----------|
| RM | ModRM:reg (w) | ModRM:r/m (r) | N/A |

Description

Compare the address in the second operand with the upper bound in bnd. The second operand can be either a register or a memory operand. If the address is higher than the upper bound in bnd.UB, it will set BNDSTATUS to 01H and signal a #BR exception.

BNDU perform 1's complement operation on the upper bound of bnd first before proceeding with address comparison. BNDN perform address comparison directly using the upper bound in bnd that is already reverted out of 1's complement form.

This instruction does not cause any memory access, and does not read or write any flags.

Effective address computation of m32/64 has identical behavior to LEA

Operation

BNDU BND, reg

```
IF reg > NOT(BND.UB) Then
    BNDSTATUS := 01H;
    #BR;
FI;
```

BNDU BND, mem

```
TEMP := LEA(mem);
IF TEMP > NOT(BND.UB) Then
    BNDSTATUS := 01H;
    #BR;
FI;
```

BNDN BND, reg

```
IF reg > BND.UB Then
    BNDSTATUS := 01H;
    #BR;
FI;
```

```

BND CN BND, mem
TEMP := LEA(mem);
IF TEMP > BND.UB Then
    BNDSTATUS := 01H;
    #BR;
FI;

BNDLDX—Load Extended Bounds Using Address Translation

| Opcode/ Instruction | Op/En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|--------------------------------|-------|------------------------------|--------------------------|--|
| NP OF 1A /r BNDLDX bnd, mib | RM | V/V | MPX | Load the bounds stored in a bound table entry (BTE) into bnd with address translation using the base of mib and conditional on the index of mib matching the pointer value in the BTE. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 |
|-------|---------------|--|-----------|
| RM | ModRM:reg (w) | SIB.base (r): Address of pointer SIB.index(r) | N/A |

Description

BNDLDX uses the linear address constructed from the base register and displacement of the SIB-addressing form of the memory operand (mib) to perform address translation to access a bound table entry and conditionally load the bounds in the BTE to the destination. The destination register is updated with the bounds in the BTE, if the content of the index register of mib matches the pointer value stored in the BTE.

If the pointer value comparison fails, the destination is updated with INIT bounds (lb = 0x0, ub = 0x0) (note: as articulated earlier, the upper bound is represented using 1's complement, therefore, the 0x0 value of upper bound allows for access to full memory).

This instruction does not cause memory access to the linear address of mib nor the effective address referenced by the base, and does not read or write any flags.

Segment overrides apply to the linear address computation with the base of mib, and are used during address translation to generate the address of the bound table entry. By default, the address of the BTE is assumed to be linear address. There are no segmentation checks performed on the base of mib.

The base of mib will not be checked for canonical address violation as it does not access memory.

Any encoding of this instruction that does not specify base or index register will treat those registers as zero (constant). The reg-reg form of this instruction will remain a NOP.

The scale field of the SIB byte has no effect on these instructions and is ignored.

The bound register may be partially updated on memory faults. The order in which memory operands are loaded is implementation specific.

Operation

```
base := mib.SIB.base ? mib.SIB.base + Disp: 0;
```

```
ptr_value := mib.SIB.index ? mib.SIB.index : 0;
```

Outside 64-bit Mode

```
A_BDE[31:0] := (Zero_extend32(base[31:12] << 2) + (BNDCFG[31:12] << 12));
```

```
A_BT[31:0] := LoadFrom(A_BDE);
```

```
IF A_BT[0] equal 0 Then
```

```
    BNDSTATUS := A_BDE | 02H;
```

```
    #BR;
```

```

```

```
Temp_ub[31:0] := LoadFrom(A_BTE + 4);
```

```
Temp_ptr[31:0] := LoadFrom(A_BTE + 8);
```

```
IF Temp_ptr equal ptr_value Then
```

```
    BND.LB := Temp_lb;
```

```
    BND.UB := Temp_ub;
```

```

ELSE
    BND.LB := 0;
    BND.UB := 0;
FI;

```

In 64-bit Mode

```

A_BDE[63:0] := (Zero_extend64(base[47+MAWA:20] << 3) + (BNDCFG[63:12] << 12));1
A_BT[63:0] := LoadFrom(A_BDE);
IF A_BT[0] equal 0 Then
    BNDSTATUS := A_BDE | 02H;
    #BR;
FI;
A_BTE[63:0] := (Zero_extend64(base[19:3] << 5) + (A_BT[63:3] << 3));
Temp_lb[63:0] := LoadFrom(A_BTE);
Temp_ub[63:0] := LoadFrom(A_BTE + 8);
Temp_ptr[63:0] := LoadFrom(A_BTE + 16);
IF Temp_ptr equal ptr_value Then
    BND.LB := Temp_lb;
    BND.UB := Temp_ub;
ELSE
    BND.LB := 0;
    BND.UB := 0;

BNDMK—Make Bounds

| Opcode/ Instruction | Op/En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|-------------------------------|-------|------------------------------|--------------------------|---|
| F3 OF 1B /r BNDMK bnd, m32 | RM | N.E./V | MPX | Make lower and upper bounds from m32 and store them in bnd. |
| F3 OF 1B /r BNDMK bnd, m64 | RM | V/N.E. | MPX | Make lower and upper bounds from m64 and store them in bnd. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 |
|-------|---------------|---------------|-----------|
| RM | ModRM:reg (w) | ModRM:r/m (r) | N/A |

Description

Makes bounds from the second operand and stores the lower and upper bounds in the bound register bnd. The second operand must be a memory operand. The content of the base register from the memory operand is stored in the lower bound bnd.LB. The 1's complement of the effective address of m32/m64 is stored in the upper bound b.UB. Computation of m32/m64 has identical behavior to LEA.

This instruction does not cause any memory access, and does not read or write any flags.

If the instruction did not specify base register, the lower bound will be zero. The reg-reg form of this instruction retains legacy behavior (NOP).

The instruction causes an invalid-opcode exception (#UD) if executed in 64-bit mode with RIP-relative addressing.

Operation

```
BND.LB := SRCMEM.base;
IF 64-bit mode Then
    BND.UB := NOT(LEA.64_bits(SRCMEM));
ELSE
    BND.UB := Zero_Extend.64_bits(NOT(LEA.32_bits(SRCMEM)));
FI;

BNDSTX—Store Extended Bounds Using Address Translation

| Opcode/ Instruction | Op/En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|--------------------------------|-------|------------------------------|--------------------------|---|
| NP OF 1B /r BNDSTX mib, bnd | MR | V/V | MPX | Store the bounds in bnd and the pointer value in the index register of mib to a bound table entry (BTE) with address translation using the base of mib. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 |
|-------|--|---------------|-----------|
| MR | SIB.base (r): Address of pointer SIB.index(r) | ModRM:reg (r) | N/A |

Description

BNDSTX uses the linear address constructed from the displacement and base register of the SIB-addressing form of the memory operand (mib) to perform address translation to store to a bound table entry. The bounds in the source operand bnd are written to the lower and upper bounds in the BTE. The content of the index register of mib is written to the pointer value field in the BTE.

This instruction does not cause memory access to the linear address of mib nor the effective address referenced by the base, and does not read or write any flags.

Segment overrides apply to the linear address computation with the base of mib, and are used during address translation to generate the address of the bound table entry. By default, the address of the BTE is assumed to be linear address. There are no segmentation checks performed on the base of mib.

The base of mib will not be checked for canonical address violation as it does not access memory.

Any encoding of this instruction that does not specify base or index register will treat those registers as zero (constant). The reg-reg form of this instruction will remain a NOP.

The scale field of the SIB byte has no effect on these instructions and is ignored.

The bound register may be partially updated on memory faults. The order in which memory operands are loaded is implementation specific.

Operation

```
base := mib.SIB.base ? mib.SIB.base + Disp: 0;
ptr_value := mib.SIB.index ? mib.SIB.index : 0;
```

Outside 64-bit Mode

```
A_BDE[31:0] := (Zero_extend32(base[31:12] << 2) + (BNDCFG[31:12] << 12);
A_BT[31:0] := LoadFrom(A_BDE);
IF A_BT[0] equal 0 Then

BOUND—Check Array Index Against Bounds

| Opcode | Instruction | Op/En | 64-bit Mode | Compat/Leg Mode | Description |
|--------|-------------------|-------|-------------|-----------------|--|
| 62 /r | BOUND r16, m16&16 | RM | Invalid | Valid | Check if r16 (array index) is within bounds specified by m16&16. |
| 62 /r | BOUND r32, m32&32 | RM | Invalid | Valid | Check if r32 (array index) is within bounds specified by m32&32. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|-----------|-----------|
| RM | ModRM:reg (r) | ModRM:r/m (r) | N/A | N/A |

Description

BOUND determines if the first operand (array index) is within the bounds of an array specified the second operand (bounds operand). The array index is a signed integer located in a register. The bounds operand is a memory location that contains a pair of signed doubleword-integers (when the operand-size attribute is 32) or a pair of signed word-integers (when the operand-size attribute is 16). The first doubleword (or word) is the lower bound of the array and the second doubleword (or word) is the upper bound of the array. The array index must be greater than or equal to the lower bound and less than or equal to the upper bound plus the operand size in bytes. If the index is not within bounds, a BOUND range exceeded exception (#BR) is signaled. When this exception is generated, the saved return instruction pointer points to the BOUND instruction.

The bounds limit data structure (two words or doublewords containing the lower and upper limits of the array) is usually placed just before the array itself, making the limits addressable via a constant offset from the beginning of the array. Because the address of the array already will be present in a register, this practice avoids extra bus cycles to obtain the effective address of the array bounds.

This instruction executes as described in compatibility mode and legacy mode. It is not valid in 64-bit mode.

Operation

```
IF 64bit Mode
  THEN
    #UD;
  ELSE
    IF (ArrayIndex < LowerBound OR ArrayIndex > UpperBound) THEN
      (* Below lower bound or above upper bound *)
      IF <equation for PL enabled> THEN BNDSTATUS := 0

BSF—Bit Scan Forward

| Opcode | Instruction | Op/En | 64-bit Mode | Compat/Leg Mode | Description |
|------------------|----------------|-------|-------------|-----------------|----------------------------|
| OF BC /r | BSF r16, r/m16 | RM | Valid | Valid | Bit scan forward on r/m16. |
| OF BC /r | BSF r32, r/m32 | RM | Valid | Valid | Bit scan forward on r/m32. |
| REX.W + OF BC /r | BSF r64, r/m64 | RM | Valid | N.E. | Bit scan forward on r/m64. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|-----------|-----------|
| RM | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Searches the source operand (second operand) for the least significant set bit (1 bit). If a least significant 1 bit is found, its bit index is stored in the destination operand (first operand). The source operand can be a register or a memory location; the destination operand is a register. The bit index is an unsigned offset from bit 0 of the source operand. If the content of the source operand is zero, the destination operand is unmodified.¹

In 64-bit mode, the instruction's default operation size is 32 bits. Using a REX prefix in the form of REX.R permits access to additional registers (R8-R15). Using a REX prefix in the form of REX.W promotes operation to 64 bits. See the summary chart at the beginning of this section for encoding data and limits.

Operation

```
IF SRC <> 0
  THEN
    temp := 0;
    WHILE Bit(SRC, temp) = 0
      DO
        temp := temp + 1;
      OD;
    DEST := temp;
  FI;
```

Flags Affected

The ZF flag is set to 1 if the source operand is 0; otherwise, the ZF flag is cleared. The PF flag is set to 1 if the number of bits set in the source operand is even; otherwise, it is cleared. The CF, OF, SF, and AF flags are all cleared.²

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

1. With a zero source operand on some older processors, use of a 32-bit operand size may clear the upper 32 bits of a 64-bit destination while leaving the lower 32 bits unmodified.
2. On some older processors, the CF, OF, SF, AF, and PF flags are unmodified.

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

BSR—Bit Scan Reverse

| Opcode | Instruction | Op/En | 64-bit Mode | Compat/Leg Mode | Description |
|------------------|----------------|-------|-------------|-----------------|----------------------------|
| OF BD /r | BSR r16, r/m16 | RM | Valid | Valid | Bit scan reverse on r/m16. |
| OF BD /r | BSR r32, r/m32 | RM | Valid | Valid | Bit scan reverse on r/m32. |
| REX.W + OF BD /r | BSR r64, r/m64 | RM | Valid | N.E. | Bit scan reverse on r/m64. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|-----------|-----------|
| RM | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Searches the source operand (second operand) for the most significant set bit (1 bit). If a most significant 1 bit is found, its bit index is stored in the destination operand (first operand). The source operand can be a register or a memory location; the destination operand is a register. The bit index is an unsigned offset from bit 0 of the source operand. If the content source operand is zero, the destination operand is unmodified.¹

In 64-bit mode, the instruction's default operation size is 32 bits. Using a REX prefix in the form of REX.R permits access to additional registers (R8-R15). Using a REX prefix in the form of REX.W promotes operation to 64 bits. See the summary chart at the beginning of this section for encoding data and limits.

Operation

```
IF SRC <> 0
    temp := OperandSize - 1;
    WHILE Bit(SRC, temp) = 0
    DO
        temp := temp - 1;
    OD;
    DEST := temp;
```

FI;

Flags Affected

The ZF flag is set to 1 if the source operand is 0; otherwise, the ZF flag is cleared. The PF flag is set to 1 if the number of bits set in the source operand is even; otherwise, it is cleared. The CF, OF, SF, and AF flags are all cleared.²

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

1. With a zero source operand on some older processors, use of a 32-bit operand size may clear the upper 32 bits of a 64-bit destination while leaving the lower 32 bits unmodified.

2. On some older processors, the CF, OF, SF, AF, and PF flags are unmodified.

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

BSWAP—Byte Swap

| Opcode | Instruction | Op/En | 64-bit Mode | Compat/Leg Mode | Description |
|--------------------------|------------------|-------|-------------|-----------------|---|
| OF C8+ <i>rd</i> | BSWAP <i>r32</i> | 0 | Valid* | Valid | Reverses the byte order of a 32-bit register. |
| REX.W + OF C8+ <i>rd</i> | BSWAP <i>r64</i> | 0 | Valid | N.E. | Reverses the byte order of a 64-bit register. |

NOTES:

* See IA-32 Architecture Compatibility section below.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|--------------------|-----------|-----------|-----------|
| 0 | opcode + rd (r, w) | N/A | N/A | N/A |

Description

Reverses the byte order of a 32-bit or 64-bit (destination) register. This instruction is provided for converting little-endian values to big-endian format and vice versa. To swap bytes in a word value (16-bit register), use the XCHG instruction. When the BSWAP instruction references a 16-bit register, the result is undefined.

In 64-bit mode, the instruction's default operation size is 32 bits. Using a REX prefix in the form of REX.B permits access to additional registers (R8-R15). Using a REX prefix in the form of REX.W promotes operation to 64 bits. See the summary chart at the beginning of this section for encoding data and limits.

IA-32 Architecture Legacy Compatibility

The BSWAP instruction is not supported on IA-32 processors earlier than the Intel486™ processor family. For compatibility with this instruction, software should include functionally equivalent code for execution on Intel processors earlier than the Intel486 processor family.

Operation

TEMP := DEST

IF 64-bit mode AND OperandSize = 64

THEN

```
DEST[7:0] := TEMP[63:56];
DEST[15:8] := TEMP[55:48];
DEST[23:16] := TEMP[47:40];
DEST[31:24] := TEMP[39:32];
DEST[39:32] := TEMP[31:24];
DEST[47:40] := TEMP[23:16];
DEST[55:48] := TEMP[15:8];
DEST[63:56] := TEMP[7:0];
```

ELSE

```
DEST[7:0] := TEMP[31:24];
DEST[15:8] := TEMP[23:16];
DEST[23:16] := TEMP[15:8];
DEST[31:24] := TEMP[7:0];
```

FI;

Flags Affected

None.

Exceptions (All Operating Modes)

#UD If the LOCK prefix is used.

BT—Bit Test

| Opcode | Instruction | Op/En | 64-bit Mode | Compat/Leg Mode | Description |
|---------------------|----------------|-------|-------------|-----------------|--------------------------------|
| OF A3 /r | BT r/m16, r16 | MR | Valid | Valid | Store selected bit in CF flag. |
| OF A3 /r | BT r/m32, r32 | MR | Valid | Valid | Store selected bit in CF flag. |
| REX.W + OF A3 /r | BT r/m64, r64 | MR | Valid | N.E. | Store selected bit in CF flag. |
| OF BA /4 ib | BT r/m16, imm8 | MI | Valid | Valid | Store selected bit in CF flag. |
| OF BA /4 ib | BT r/m32, imm8 | MI | Valid | Valid | Store selected bit in CF flag. |
| REX.W + OF BA /4 ib | BT r/m64, imm8 | MI | Valid | N.E. | Store selected bit in CF flag. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|-----------|-----------|
| MR | ModRM:r/m (r) | ModRM:reg (r) | N/A | N/A |
| MI | ModRM:r/m (r) | imm8 | N/A | N/A |

Description

Selects the bit in a bit string (specified with the first operand, called the bit base) at the bit-position designated by the bit offset (specified by the second operand) and stores the value of the bit in the CF flag. The bit base operand can be a register or a memory location; the bit offset operand can be a register or an immediate value:

- If the bit base operand specifies a register, the instruction takes the modulo 16, 32, or 64 of the bit offset operand (modulo size depends on the mode and register size; 64-bit operands are available only in 64-bit mode).
- If the bit base operand specifies a memory location, the operand represents the address of the byte in memory that contains the bit base (bit 0 of the specified byte) of the bit string. The range of the bit position that can be referenced by the offset operand depends on the operand size.

See also: **Bit(BitBase, BitOffset)** on page 3-11.

Some assemblers support immediate bit offsets larger than 31 by using the immediate bit offset field in combination with the displacement field of the memory operand. In this case, the low-order 3 or 5 bits (3 for 16-bit operands, 5 for 32-bit operands) of the immediate bit offset are stored in the immediate bit offset field, and the high-order bits are shifted and combined with the byte displacement in the addressing mode by the assembler. The processor will ignore the high order bits if they are not zero.

When accessing a bit in memory, the processor may access 4 bytes starting from the memory address for a 32-bit operand size, using by the following relationship:

$$\text{Effective Address} + (4 * (\text{BitOffset} \text{ DIV } 32))$$

Or, it may access 2 bytes starting from the memory address for a 16-bit operand, using this relationship:

$$\text{Effective Address} + (2 * (\text{BitOffset} \text{ DIV } 16))$$

It may do so even when only a single byte needs to be accessed to reach the given bit. When using this bit addressing mechanism, software should avoid referencing areas of memory close to address space holes. In particular, it should avoid references to memory-mapped I/O registers. Instead, software should use the MOV instructions to load from or store to these addresses, and use the register form of these instructions to manipulate the data.

In 64-bit mode, the instruction's default operation size is 32 bits. Using a REX prefix in the form of REX.R permits access to additional registers (R8-R15). Using a REX prefix in the form of REX.W promotes operation to 64 bit operands. See the summary chart at the beginning of this section for encoding data and limits.

Operation

CF := Bit(BitBase, BitOffset);

Flags Affected

The CF flag contains the value of the selected bit. The ZF flag is unaffected. The OF, SF, AF, and PF flags are undefined.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

BTC—Bit Test and Complement

| Opcode | Instruction | Op/En | 64-bit Mode | Compat/Leg Mode | Description |
|---------------------|-----------------|-------|-------------|-----------------|---|
| OF BB /r | BTC r/m16, r16 | MR | Valid | Valid | Store selected bit in CF flag and complement. |
| OF BB /r | BTC r/m32, r32 | MR | Valid | Valid | Store selected bit in CF flag and complement. |
| REX.W + OF BB /r | BTC r/m64, r64 | MR | Valid | N.E. | Store selected bit in CF flag and complement. |
| OF BA /7 ib | BTC r/m16, imm8 | MI | Valid | Valid | Store selected bit in CF flag and complement. |
| OF BA /7 ib | BTC r/m32, imm8 | MI | Valid | Valid | Store selected bit in CF flag and complement. |
| REX.W + OF BA /7 ib | BTC r/m64, imm8 | MI | Valid | N.E. | Store selected bit in CF flag and complement. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------------|---------------|-----------|-----------|
| MR | ModRM:r/m (r, w) | ModRM:reg (r) | N/A | N/A |
| MI | ModRM:r/m (r, w) | imm8 | N/A | N/A |

Description

Selects the bit in a bit string (specified with the first operand, called the bit base) at the bit-position designated by the bit offset operand (second operand), stores the value of the bit in the CF flag, and complements the selected bit in the bit string. The bit base operand can be a register or a memory location; the bit offset operand can be a register or an immediate value:

- If the bit base operand specifies a register, the instruction takes the modulo 16, 32, or 64 of the bit offset operand (modulo size depends on the mode and register size; 64-bit operands are available only in 64-bit mode). This allows any bit position to be selected.
- If the bit base operand specifies a memory location, the operand represents the address of the byte in memory that contains the bit base (bit 0 of the specified byte) of the bit string. The range of the bit position that can be referenced by the offset operand depends on the operand size.

See also: **Bit(BitBase, BitOffset)** on page 3-11.

Some assemblers support immediate bit offsets larger than 31 by using the immediate bit offset field in combination with the displacement field of the memory operand. See “BT—Bit Test” in this chapter for more information on this addressing mechanism.

This instruction can be used with a LOCK prefix to allow the instruction to be executed atomically.

In 64-bit mode, the instruction’s default operation size is 32 bits. Using a REX prefix in the form of REX.B permits access to additional registers (R8-R15) for the bit base. Using a REX prefix in the form of REX.R permits access to R8-R15 for the bit offset (when it uses a register). Using a REX prefix in the form of REX.W promotes operation to 64 bits. See the summary chart at the beginning of this section for encoding data and limits.

Operation

CF := Bit(BitBase, BitOffset);

Bit(BitBase, BitOffset) := NOT Bit(BitBase, BitOffset);

Flags Affected

The CF flag contains the value of the selected bit before it is complemented. The ZF flag is unaffected. The OF, SF, AF, and PF flags are undefined.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If the destination operand points to a non-writable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |

| MR | ModRM:r/m (r, w) | ModRM:reg (r) | N/A | N/A |
| MI | ModRM:r/m (r, w) | imm8 | N/A | N/A |

Description

Selects the bit in a bit string (specified with the first operand, called the bit base) at the bit-position designated by the bit offset operand (second operand), stores the value of the bit in the CF flag, and clears the selected bit in the bit string to 0. The bit base operand can be a register or a memory location; the bit offset operand can be a register or an immediate value:

- If the bit base operand specifies a register, the instruction takes the modulo 16, 32, or 64 of the bit offset operand (modulo size depends on the mode and register size; 64-bit operands are available only in 64-bit mode). This allows any bit position to be selected.
- If the bit base operand specifies a memory location, the operand represents the address of the byte in memory that contains the bit base (bit 0 of the specified byte) of the bit string. The range of the bit position that can be referenced by the offset operand depends on the operand size.

See also: **Bit(BitBase, BitOffset)** on page 3-11.

Some assemblers support immediate bit offsets larger than 31 by using the immediate bit offset field in combination with the displacement field of the memory operand. See “BT—Bit Test” in this chapter for more information on this addressing mechanism.

This instruction can be used with a LOCK prefix to allow the instruction to be executed atomically.

In 64-bit mode, the instruction’s default operation size is 32 bits. Using a REX prefix in the form of REX.R permits access to additional registers (R8-R15). Using a REX prefix in the form of REX.W promotes operation to 64 bits. See the summary chart at the beginning of this section for encoding data and limits.

Operation

CF := Bit(BitBase, BitOffset);

Bit(BitBase, BitOffset) := 0;

Flags Affected

The CF flag contains the value of the selected bit before it is cleared. The ZF flag is unaffected. The OF, SF, AF, and PF flags are undefined.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If the destination operand points to a non-writable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a NULL segment selector. |

Description

Selects the bit in a bit string (specified with the first operand, called the bit base) at the bit-position designated by the bit offset operand (second operand), stores the value of the bit in the CF flag, and sets the selected bit in the bit string to 1. The bit base operand can be a register or a memory location; the bit offset operand can be a register or an immediate value:

- If the bit base operand specifies a register, the instruction takes the modulo 16, 32, or 64 of the bit offset operand (modulo size depends on the mode and register size; 64-bit operands are available only in 64-bit mode). This allows any bit position to be selected.
- If the bit base operand specifies a memory location, the operand represents the address of the byte in memory that contains the bit base (bit 0 of the specified byte) of the bit string. The range of the bit position that can be referenced by the offset operand depends on the operand size.

See also: **Bit(BitBase, BitOffset)** on page 3-11.

Some assemblers support immediate bit offsets larger than 31 by using the immediate bit offset field in combination with the displacement field of the memory operand. See “BT—Bit Test” in this chapter for more information on this addressing mechanism.

This instruction can be used with a LOCK prefix to allow the instruction to be executed atomically.

In 64-bit mode, the instruction’s default operation size is 32 bits. Using a REX prefix in the form of REX.R permits access to additional registers (R8-R15). Using a REX prefix in the form of REX.W promotes operation to 64 bits. See the summary chart at the beginning of this section for encoding data and limits.

Operation

CF := Bit(BitBase, BitOffset);

Bit(BitBase, BitOffset) := 1;

Flags Affected

The CF flag contains the value of the selected bit before it is set. The ZF flag is unaffected. The OF, SF, AF, and PF flags are undefined.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If the destination operand points to a non-writable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a NULL segment selector. |

| #GP(0) | If the memory address is in a non-canonical form. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

BZHI—Zero High Bits Starting with Specified Bit Position

| Opcode/Instruction | Op/En | 64/32-bit Mode | CPUID Feature Flag | Description |
|--|-------|----------------|--------------------|--|
| VEX.LZ.OF38.W0 F5 /r BZHI r32a, r/m32, r32b | RMV | V/V | BMI2 | Zero bits in r/m32 starting with the position in r32b, write result to r32a. |
| VEX.LZ.OF38.W1 F5 /r BZHI r64a, r/m64, r64b | RMV | V/N.E. | BMI2 | Zero bits in r/m64 starting with the position in r64b, write result to r64a. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|--------------|-----------|
| RMV | ModRM:reg (w) | ModRM:r/m (r) | VEX.vvvv (r) | N/A |

Description

BZHI copies the bits of the first source operand (the second operand) into the destination operand (the first operand) and clears the higher bits in the destination according to the INDEX value specified by the second source operand (the third operand). The INDEX is specified by bits 7:0 of the second source operand. The INDEX value is saturated at the value of OperandSize - 1. CF is set, if the number contained in the 8 low bits of the third operand is greater than OperandSize - 1.

This instruction is not supported in real mode and virtual-8086 mode. The operand size is always 32 bits if not in 64-bit mode. In 64-bit mode operand size 64 requires VEX.W1. VEX.W1 is ignored in non-64-bit modes. An attempt to execute this instruction with VEX.L not equal to 0 will cause #UD.

Operation

```
N := SRC2[7:0]
DEST := SRC1
IF (N < OperandSize)
    DEST[OperandSize-1:N] := 0
FI
IF (N > OperandSize - 1)
    CF := 1
ELSE
    CF := 0
FI
```

Flags Affected

ZF and SF flags are updated based on the result. CF flag is set as specified in the Operation section. OF flag is cleared. AF and PF flags are undefined.

Intel C/C++ Compiler Intrinsic Equivalent

```
BZHI unsigned __int32 _bzhi_u32(unsigned __int32 src, unsigned __int32 index);
BZHI unsigned __int64 _bzhi_u64(unsigned __int64 src, unsigned __int32 index);
```

SIMD Floating-Point Exceptions

None.

Other Exceptions

See Table 2-29, "Type 13 Class Exception Conditions."

CALL—Call Procedure

| Opcode | Instruction | Op/En | 64-bit Mode | Compat/Leg Mode | Description |
|-------------|---------------|-------|-------------|-----------------|--|
| E8 cw | CALL rel16 | D | N.S. | Valid | Call near, relative, displacement relative to next instruction. |
| E8 cd | CALL rel32 | D | Valid | Valid | Call near, relative, displacement relative to next instruction. 32-bit displacement sign extended to 64-bits in 64-bit mode. |
| FF /2 | CALL r/m16 | M | N.E. | Valid | Call near, absolute indirect, address given in r/m16. |
| FF /2 | CALL r/m32 | M | N.E. | Valid | Call near, absolute indirect, address given in r/m32. |
| FF /2 | CALL r/m64 | M | Valid | N.E. | Call near, absolute indirect, address given in r/m64. |
| 9A cd | CALL ptr16:16 | D | Invalid | Valid | Call far, absolute, address given in operand. |
| 9A cp | CALL ptr16:32 | D | Invalid | Valid | Call far, absolute, address given in operand. |
| FF /3 | CALL m16:16 | M | Valid | Valid | Call far, absolute indirect address given in m16:16. In 32-bit mode: if selector points to a gate, then RIP = 32-bit zero extended displacement taken from gate; else RIP = zero extended 16-bit offset from far pointer referenced in the instruction. |
| FF /3 | CALL m16:32 | M | Valid | Valid | In 64-bit mode: If selector points to a gate, then RIP = 64-bit displacement taken from gate; else RIP = zero extended 32-bit offset from far pointer referenced in the instruction. |
| REX.W FF /3 | CALL m16:64 | M | Valid | N.E. | In 64-bit mode: If selector points to a gate, then RIP = 64-bit displacement taken from gate; else RIP = 64-bit offset from far pointer referenced in the instruction. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|-----------|-----------|-----------|
| D | Offset | N/A | N/A | N/A |
| M | ModRM:r/m (r) | N/A | N/A | N/A |

Description

Saves procedure linking information on the stack and branches to the called procedure specified using the target operand. The target operand specifies the address of the first instruction in the called procedure. The operand can be an immediate value, a general-purpose register, or a memory location.

This instruction can be used to execute four types of calls:

- **Near Call** — A call to a procedure in the current code segment (the segment currently pointed to by the CS register), sometimes referred to as an intra-segment call.
- **Far Call** — A call to a procedure located in a different segment than the current code segment, sometimes referred to as an inter-segment call.
- **Inter-privilege-level far call** — A far call to a procedure in a segment at a different privilege level than that of the currently executing program or procedure.
- **Task switch** — A call to a procedure located in a different task.

The latter two call types (inter-privilege-level call and task switch) can only be executed in protected mode. See “Calling Procedures Using Call and RET” in Chapter 6 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1, for additional information on near, far, and inter-privilege-level calls. See Chapter 9, “Task Management,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A, for information on performing task switches with the CALL instruction.

Near Call. When executing a near call, the processor pushes the value of the EIP register (which contains the offset of the instruction following the CALL instruction) on the stack (for use later as a return-instruction pointer). The processor then branches to the address in the current code segment specified by the target operand. The target operand specifies either an absolute offset in the code segment (an offset from the base of the code segment) or a relative offset (a signed displacement relative to the current value of the instruction pointer in the EIP register; this value points to the instruction following the CALL instruction). The CS register is not changed on near calls.

For a near call absolute, an absolute offset is specified indirectly in a general-purpose register or a memory location (*r/m16*, *r/m32*, or *r/m64*). The operand-size attribute determines the size of the target operand (16, 32 or 64 bits). When in 64-bit mode, the operand size for near call (and all near branches) is forced to 64-bits. Absolute offsets are loaded directly into the EIP(RIP) register. If the operand size attribute is 16, the upper two bytes of the EIP register are cleared, resulting in a maximum instruction pointer size of 16 bits. When accessing an absolute offset indirectly using the stack pointer [ESP] as the base register, the base value used is the value of the ESP before the instruction executes.

A relative offset (*rel16* or *rel32*) is generally specified as a label in assembly code. But at the machine code level, it is encoded as a signed, 16- or 32-bit immediate value. This value is added to the value in the EIP(RIP) register. In 64-bit mode the relative offset is always a 32-bit immediate value which is sign extended to 64-bits before it is added to the value in the RIP register for the target calculation. As with absolute offsets, the operand-size attribute determines the size of the target operand (16, 32, or 64 bits). In 64-bit mode the target operand will always be 64-bits because the operand size is forced to 64-bits for near branches.

Far Calls in Real-Address or Virtual-8086 Mode. When executing a far call in real- address or virtual-8086 mode, the processor pushes the current value of both the CS and EIP registers on the stack for use as a return-instruction pointer. The processor then performs a “far branch” to the code segment and offset specified with the target operand for the called procedure. The target operand specifies an absolute far address either directly with a pointer (*ptr16:16* or *ptr16:32*) or indirectly with a memory location (*m16:16* or *m16:32*). With the pointer method, the segment and offset of the called procedure is encoded in the instruction using a 4-byte (16-bit operand size) or 6-byte (32-bit operand size) far address immediate. With the indirect method, the target operand specifies a memory location that contains a 4-byte (16-bit operand size) or 6-byte (32-bit operand size) far address. The operand-size attribute determines the size of the offset (16 or 32 bits) in the far address. The far address is loaded directly into the CS and EIP registers. If the operand-size attribute is 16, the upper two bytes of the EIP register are cleared.

Far Calls in Protected Mode. When the processor is operating in protected mode, the CALL instruction can be used to perform the following types of far calls:

- Far call to the same privilege level
- Far call to a different privilege level (inter-privilege level call)
- Task switch (far call to another task)

In protected mode, the processor always uses the segment selector part of the far address to access the corresponding descriptor in the GDT or LDT. The descriptor type (code segment, call gate, task gate, or TSS) and access rights determine the type of call operation to be performed.

If the selected descriptor is for a code segment, a far call to a code segment at the same privilege level is performed. (If the selected code segment is at a different privilege level and the code segment is non-conforming, a general-protection exception is generated.) A far call to the same privilege level in protected mode is very similar to one carried out in real-address or virtual-8086 mode. The target operand specifies an absolute far address either directly with a pointer (*ptr16:16* or *ptr16:32*) or indirectly with a memory location (*m16:16* or *m16:32*). The operand- size attribute determines the size of the offset (16 or 32 bits) in the far address. The new code segment selector and its descriptor are loaded into CS register; the offset from the instruction is loaded into the EIP register.

A call gate (described in the next paragraph) can also be used to perform a far call to a code segment at the same privilege level. Using this mechanism provides an extra level of indirection and is the preferred method of making calls between 16-bit and 32-bit code segments.

When executing an inter-privilege-level far call, the code segment for the procedure being called must be accessed through a call gate. The segment selector specified by the target operand identifies the call gate. The target operand can specify the call gate segment selector either directly with a pointer (*ptr16:16* or *ptr16:32*) or indirectly with a memory location (*m16:16* or *m16:32*). The processor obtains the segment selector for the new code segment and the new instruction pointer (offset) from the call gate descriptor. (The offset from the target operand is ignored when a call gate is used.)

On inter-privilege-level calls, the processor switches to the stack for the privilege level of the called procedure. The segment selector for the new stack segment is specified in the TSS for the currently running task. The branch to the new code segment occurs after the stack switch. (Note that when using a call gate to perform a far call to a segment at the same privilege level, no stack switch occurs.) On the new stack, the processor pushes the segment selector and stack pointer for the calling procedure's stack, an optional set of parameters from the calling procedure's stack, and the segment selector and instruction pointer for the calling procedure's code segment. (A value in the call gate descriptor determines how many parameters to copy to the new stack.) Finally, the processor branches to the address of the procedure being called within the new code segment.

Executing a task switch with the CALL instruction is similar to executing a call through a call gate. The target operand specifies the segment selector of the task gate for the new task activated by the switch (the offset in the target operand is ignored). The task gate in turn points to the TSS for the new task, which contains the segment selectors for the task's code and stack segments. Note that the TSS also contains the EIP value for the next instruction that was to be executed before the calling task was suspended. This instruction pointer value is loaded into the EIP register to re-start the calling task.

The CALL instruction can also specify the segment selector of the TSS directly, which eliminates the indirection of the task gate. See Chapter 9, "Task Management," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A, for information on the mechanics of a task switch.

When you execute a task switch with a CALL instruction, the nested task flag (NT) is set in the EFLAGS register and the new TSS's previous task link field is loaded with the old task's TSS selector. Code is expected to suspend this nested task by executing an IRET instruction which, because the NT flag is set, automatically uses the previous task link to return to the calling task. (See "Task Linking" in Chapter 9 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A, for information on nested tasks.) Switching tasks with the CALL instruction differs in this regard from JMP instruction. JMP does not set the NT flag and therefore does not expect an IRET instruction to suspend the task.

Mixing 16-Bit and 32-Bit Calls. When making far calls between 16-bit and 32-bit code segments, use a call gate. If the far call is from a 32-bit code segment to a 16-bit code segment, the call should be made from the first 64 KBytes of the 32-bit code segment. This is because the operand-size attribute of the instruction is set to 16, so only a 16-bit return address offset can be saved. Also, the call should be made using a 16-bit call gate so that 16-bit values can be pushed on the stack. See Chapter 23, "Mixing 16-Bit and 32-Bit Code," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B, for more information.

Far Calls in Compatibility Mode. When the processor is operating in compatibility mode, the CALL instruction can be used to perform the following types of far calls:

- Far call to the same privilege level, remaining in compatibility mode
- Far call to the same privilege level, transitioning to 64-bit mode
- Far call to a different privilege level (inter-privilege level call), transitioning to 64-bit mode

Note that a CALL instruction can not be used to cause a task switch in compatibility mode since task switches are not supported in IA-32e mode.

In compatibility mode, the processor always uses the segment selector part of the far address to access the corresponding descriptor in the GDT or LDT. The descriptor type (code segment, call gate) and access rights determine the type of call operation to be performed.

If the selected descriptor is for a code segment, a far call to a code segment at the same privilege level is performed. (If the selected code segment is at a different privilege level and the code segment is non-conforming, a general-protection exception is generated.) A far call to the same privilege level in compatibility mode is very similar to one carried out in protected mode. The target operand specifies an absolute far address either directly with a pointer (*ptr16:16* or *ptr16:32*) or indirectly with a memory location (*m16:16* or *m16:32*). The operand-size attribute determines the size of the offset (16 or 32 bits) in the far address. The new code segment selector and its descriptor are loaded into CS register and the offset from the instruction is loaded into the EIP register. The difference is that 64-bit mode may be entered. This is specified by the L bit in the new code segment descriptor.

Note that a 64-bit call gate (described in the next paragraph) can also be used to perform a far call to a code segment at the same privilege level. However, using this mechanism requires that the target code segment descriptor have the L bit set, causing an entry to 64-bit mode.

When executing an inter-privilege-level far call, the code segment for the procedure being called must be accessed through a 64-bit call gate. The segment selector specified by the target operand identifies the call gate. The target

operand can specify the call gate segment selector either directly with a pointer (*ptr16:16* or *ptr16:32*) or indirectly with a memory location (*m16:16* or *m16:32*). The processor obtains the segment selector for the new code segment and the new instruction pointer (offset) from the 16-byte call gate descriptor. (The offset from the target operand is ignored when a call gate is used.)

On inter-privilege-level calls, the processor switches to the stack for the privilege level of the called procedure. The segment selector for the new stack segment is set to NULL. The new stack pointer is specified in the TSS for the currently running task. The branch to the new code segment occurs after the stack switch. (Note that when using a call gate to perform a far call to a segment at the same privilege level, an implicit stack switch occurs as a result of entering 64-bit mode. The SS selector is unchanged, but stack segment accesses use a segment base of 0x0, the limit is ignored, and the default stack size is 64-bits. The full value of RSP is used for the offset, of which the upper 32-bits are undefined.) On the new stack, the processor pushes the segment selector and stack pointer for the calling procedure's stack and the segment selector and instruction pointer for the calling procedure's code segment. (Parameter copy is not supported in IA-32e mode.) Finally, the processor branches to the address of the procedure being called within the new code segment.

Near/(Far) Calls in 64-bit Mode. When the processor is operating in 64-bit mode, the CALL instruction can be used to perform the following types of far calls:

- Far call to the same privilege level, transitioning to compatibility mode
- Far call to the same privilege level, remaining in 64-bit mode
- Far call to a different privilege level (inter-privilege level call), remaining in 64-bit mode

Note that in this mode the CALL instruction can not be used to cause a task switch in 64-bit mode since task switches are not supported in IA-32e mode.

In 64-bit mode, the processor always uses the segment selector part of the far address to access the corresponding descriptor in the GDT or LDT. The descriptor type (code segment, call gate) and access rights determine the type of call operation to be performed.

If the selected descriptor is for a code segment, a far call to a code segment at the same privilege level is performed. (If the selected code segment is at a different privilege level and the code segment is non-conforming, a general-protection exception is generated.) A far call to the same privilege level in 64-bit mode is very similar to one carried out in compatibility mode. The target operand specifies an absolute far address indirectly with a memory location (*m16:16*, *m16:32* or *m16:64*). The form of CALL with a direct specification of absolute far address is not defined in 64-bit mode. The operand-size attribute determines the size of the offset (16, 32, or 64 bits) in the far address. The new code segment selector and its descriptor are loaded into the CS register; the offset from the instruction is loaded into the EIP register. The new code segment may specify entry either into compatibility or 64-bit mode, based on the L bit value.

A 64-bit call gate (described in the next paragraph) can also be used to perform a far call to a code segment at the same privilege level. However, using this mechanism requires that the target code segment descriptor have the L bit set.

When executing an inter-privilege-level far call, the code segment for the procedure being called must be accessed through a 64-bit call gate. The segment selector specified by the target operand identifies the call gate. The target operand can only specify the call gate segment selector indirectly with a memory location (*m16:16*, *m16:32* or *m16:64*). The processor obtains the segment selector for the new code segment and the new instruction pointer (offset) from the 16-byte call gate descriptor. (The offset from the target operand is ignored when a call gate is used.)

On inter-privilege-level calls, the processor switches to the stack for the privilege level of the called procedure. The segment selector for the new stack segment is set to NULL. The new stack pointer is specified in the TSS for the currently running task. The branch to the new code segment occurs after the stack switch.

Note that when using a call gate to perform a far call to a segment at the same privilege level, an implicit stack switch occurs as a result of entering 64-bit mode. The SS selector is unchanged, but stack segment accesses use a segment base of 0x0, the limit is ignored, and the default stack size is 64-bits. (The full value of RSP is used for the offset.) On the new stack, the processor pushes the segment selector and stack pointer for the calling procedure's stack and the segment selector and instruction pointer for the calling procedure's code segment. (Parameter copy is not supported in IA-32e mode.) Finally, the processor branches to the address of the procedure being called within the new code segment.

Refer to Chapter 6, “Procedure Calls, Interrupts, and Exceptions,” and Chapter 18, “Control-flow Enforcement Technology (CET),” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1, for CET details.

Instruction ordering. Instructions following a far call may be fetched from memory before earlier instructions complete execution, but they will not execute (even speculatively) until all instructions prior to the far call have completed execution (the later instructions may execute before data stored by the earlier instructions have become globally visible).

Instructions sequentially following a near indirect CALL instruction (i.e., those not at the target) may be executed speculatively. If software needs to prevent this (e.g., in order to prevent a speculative execution side channel), then an LFENCE instruction opcode can be placed after the near indirect CALL in order to block speculative execution.

CBW/CWDE/CDQE—Convert Byte to Word/Convert Word to Doubleword/Convert Doubleword to Quadword

| Opcode | Instruction | Op/En | 64-bit Mode | Compat/Leg Mode | Description |
|------------|-------------|-------|-------------|-----------------|----------------------------|
| 98 | CBW | Z0 | Valid | Valid | AX := sign-extend of AL. |
| 98 | CWDE | Z0 | Valid | Valid | EAX := sign-extend of AX. |
| REX.W + 98 | CDQE | Z0 | Valid | N.E. | RAX := sign-extend of EAX. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Double the size of the source operand by means of sign extension. The CBW (convert byte to word) instruction copies the sign (bit 7) in the source operand into every bit in the AH register. The CWDE (convert word to doubleword) instruction copies the sign (bit 15) of the word in the AX register into the high 16 bits of the EAX register.

CBW and CWDE reference the same opcode. The CBW instruction is intended for use when the operand-size attribute is 16; CWDE is intended for use when the operand-size attribute is 32. Some assemblers may force the operand size. Others may treat these two mnemonics as synonyms (CBW/CWDE) and use the setting of the operand-size attribute to determine the size of values to be converted.

In 64-bit mode, the default operation size is the size of the destination register. Use of the REX.W prefix promotes this instruction (CDQE when promoted) to operate on 64-bit operands. In which case, CDQE copies the sign (bit 31) of the doubleword in the EAX register into the high 32 bits of RAX.

Operation

```
IF OperandSize = 16 (* Instruction = CBW *)
  THEN
    AX := SignExtend(AL);
  ELSE IF (OperandSize = 32, Instruction = CWDE)
    EAX := SignExtend(AX); FI;
  ELSE (* 64-Bit Mode, OperandSize = 64, Instruction = CDQE*)
    RAX := SignExtend(EAX);
  FI;
```

Flags Affected

None.

Exceptions (All Operating Modes)

#UD If the LOCK prefix is used.

CLAC—Clear AC Flag in EFLAGS Register

| Opcode/ Instruction | Op / En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|------------------------|------------|------------------------------|--------------------------|---|
| NP 0F 01 CA CLAC | Z0 | V/V | SMAP | Clear the AC flag in the EFLAGS register. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Clears the AC flag bit in EFLAGS register. This disables any alignment checking of user-mode data accesses. If the SMAP bit is set in the CR4 register, this disallows explicit supervisor-mode data accesses to user-mode pages.

This instruction's operation is the same in non-64-bit modes and 64-bit mode. Attempts to execute CLAC when CPL > 0 cause #UD.

Operation

EFLAGS.AC := 0;

Flags Affected

AC cleared. Other flags are unaffected.

Protected Mode Exceptions

#UD
If the LOCK prefix is used.
If the CPL > 0.
If CPUID.(EAX=07H, ECX=0H):EBX.SMAP[bit 20] = 0.

Real-Address Mode Exceptions

#UD
If the LOCK prefix is used.
If CPUID.(EAX=07H, ECX=0H):EBX.SMAP[bit 20] = 0.

Virtual-8086 Mode Exceptions

#UD
The CLAC instruction is not recognized in virtual-8086 mode.

Compatibility Mode Exceptions

#UD
If the LOCK prefix is used.
If the CPL > 0.
If CPUID.(EAX=07H, ECX=0H):EBX.SMAP[bit 20] = 0.

64-Bit Mode Exceptions

#UD
If the LOCK prefix is used.
If the CPL > 0.
If CPUID.(EAX=07H, ECX=0H):EBX.SMAP[bit 20] = 0.

CLC—Clear Carry Flag

| Opcode | Instruction | Op/En | 64-bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------|-------------|-----------------|----------------|
| F8 | CLC | Z0 | Valid | Valid | Clear CF flag. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Clears the CF flag in the EFLAGS register. Operation is the same in all modes.

Operation

CF := 0;

Flags Affected

The CF flag is set to 0. The OF, ZF, SF, AF, and PF flags are unaffected.

Exceptions (All Operating Modes)

#UD If the LOCK prefix is used.

CLD—Clear Direction Flag

| Opcode | Instruction | Op/En | 64-bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------|-------------|-----------------|----------------|
| FC | CLD | Z0 | Valid | Valid | Clear DF flag. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Clears the DF flag in the EFLAGS register. When the DF flag is set to 0, string operations increment the index registers (ESI and/or EDI). Operation is the same in all modes.

Operation

DF := 0;

Flags Affected

The DF flag is set to 0. The CF, OF, ZF, SF, AF, and PF flags are unaffected.

Exceptions (All Operating Modes)

#UD If the LOCK prefix is used.

CLDEMOTE—Cache Line Demote

| Opcode/ Instruction | Op/ En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|----------------------------|-----------|------------------------------|-----------------------|--|
| NP OF 1C /0 CLDEMOTE m8 | A | V/V | CLDEMOTE | Hint to hardware to move the cache line containing m8 to a more distant level of the cache without writing back to memory. |

Instruction Operand Encoding¹

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|-----------|-----------|-----------|
| A | ModRM:r/m (w) | N/A | N/A | N/A |

Description

Hints to hardware that the cache line that contains the linear address specified with the memory operand should be moved (“demoted”) from the cache(s) closest to the processor core to a level more distant from the processor core. This may accelerate subsequent accesses to the line by other cores in the same coherence domain, especially if the line was written by the core that demotes the line. Moving the line in such a manner is a performance optimization, i.e., it is a hint which does not modify architectural state. Hardware may choose which level in the cache hierarchy to retain the line (e.g., L3 in typical server designs). The source operand is a byte memory location.

The availability of the CLDEMOTE instruction is indicated by the presence of the CPUID feature flag CLDEMOTE (bit 25 of the ECX register in sub-leaf 07H, see “CPUID—CPU Identification”). On processors which do not support the CLDEMOTE instruction (including legacy hardware) the instruction will be treated as a NOP.

A CLDEMOTE instruction is ordered with respect to stores to the same cache line, but unordered with respect to other instructions including memory fences, CLDEMOTE, CLWB or CLFLUSHOPT instructions to a different cache line. Since CLDEMOTE will retire in order with respect to stores to the same cache line, software should ensure that after issuing CLDEMOTE the line is not accessed again immediately by the same core to avoid cache data movement penalties.

The effective memory type of the page containing the affected line determines the effect; cacheable types are likely to generate a data movement operation, while uncacheable types may cause the instruction to be ignored.

Speculative fetching can occur at any time and is not tied to instruction execution. The CLDEMOTE instruction is not ordered with respect to PREFETCHH instructions or any of the speculative fetching mechanisms. That is, data can be speculatively loaded into a cache line just before, during, or after the execution of a CLDEMOTE instruction that references the cache line.

Unlike CLFLUSH, CLFLUSHOPT, and CLWB instructions, CLDEMOTE is not guaranteed to write back modified data to memory.

The CLDEMOTE instruction may be ignored by hardware in certain cases and is not a guarantee.

The CLDEMOTE instruction can be used at all privilege levels. In certain processor implementations the CLDEMOTE instruction may set the A bit but not the D bit in the page tables.

If the line is not found in the cache, the instruction will be treated as a NOP.

In some implementations, the CLDEMOTE instruction may always cause a transactional abort with Transactional Synchronization Extensions (TSX). However, programmers must not rely on CLDEMOTE instruction to force a transactional abort.

1. The Mod field of the ModR/M byte cannot have value 11B.

Operation

Cache_Line_Demote(m8);

Flags Affected

None.

C/C++ Compiler Intrinsic Equivalent

CLDEMOTE void _cldemote(const void*);

Protected Mode Exceptions

#UD If the LOCK prefix is used.

Real-Address Mode Exceptions

#UD If the LOCK prefix is used.

Virtual-8086 Mode Exceptions

Same exceptions as in real address mode.

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

#UD If the LOCK prefix is used.

CLFLUSH—Flush Cache Line

| Opcode / Instruction | Op/En | 64-bit Mode | Compat/Leg Mode | Description |
|----------------------------------|-------|-------------|-----------------|---|
| NP OF AE /7 CLFLUSH <i>m8</i> | M | Valid | Valid | Flushes cache line containing <i>m8</i> . |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|-----------|-----------|-----------|
| M | ModRM:r/m (w) | N/A | N/A | N/A |

Description

Invalidates from every level of the cache hierarchy in the cache coherence domain the cache line that contains the linear address specified with the memory operand. If that cache line contains modified data at any level of the cache hierarchy, that data is written back to memory. The source operand is a byte memory location.

The availability of CLFLUSH is indicated by the presence of the CPUID feature flag CLFSH (CPUID.01H:EDX[bit 19]). The aligned cache line size affected is also indicated with the CPUID instruction (bits 8 through 15 of the EBX register when the initial value in the EAX register is 1).

The memory attribute of the page containing the affected line has no effect on the behavior of this instruction. It should be noted that processors are free to speculatively fetch and cache data from system memory regions assigned a memory-type allowing for speculative reads (such as, the WB, WC, and WT memory types). PREFETCH instructions can be used to provide the processor with hints for this speculative behavior. Because this speculative fetching can occur at any time and is not tied to instruction execution, the CLFLUSH instruction is not ordered with respect to PREFETCH instructions or any of the speculative fetching mechanisms (that is, data can be speculatively loaded into a cache line just before, during, or after the execution of a CLFLUSH instruction that references the cache line).

Executions of the CLFLUSH instruction are ordered with respect to each other and with respect to writes, locked read-modify-write instructions, and fence instructions.¹ They are not ordered with respect to executions of CLFLUSHOPT and CLWB. Software can use the SFENCE instruction to order an execution of CLFLUSH relative to one of those operations.

The CLFLUSH instruction can be used at all privilege levels and is subject to all permission checking and faults associated with a byte load (and in addition, a CLFLUSH instruction is allowed to flush a linear address in an execute-only segment). Like a load, the CLFLUSH instruction sets the A bit but not the D bit in the page tables.

In some implementations, the CLFLUSH instruction may always cause transactional abort with Transactional Synchronization Extensions (TSX). The CLFLUSH instruction is not expected to be commonly used inside typical transactional regions. However, programmers must not rely on CLFLUSH instruction to force a transactional abort, since whether they cause transactional abort is implementation dependent.

The CLFLUSH instruction was introduced with the SSE2 extensions; however, because it has its own CPUID feature flag, it can be implemented in IA-32 processors that do not include the SSE2 extensions. Also, detecting the presence of the SSE2 extensions with the CPUID instruction does not guarantee that the CLFLUSH instruction is implemented in the processor.

CLFLUSH operation is the same in non-64-bit modes and 64-bit mode.

Operation

Flush_Cache_Line(SRC);

Intel C/C++ Compiler Intrinsic Equivalents

CLFLUSH void _mm_clflush(void const *p)

1. Earlier versions of this manual specified that executions of the CLFLUSH instruction were ordered only by the MFENCE instruction. All processors implementing the CLFLUSH instruction also order it relative to the other operations enumerated above.

Protected Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | For an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| #SS(0) | For an illegal address in the SS segment. |
| #PF(fault-code) | For a page fault. |
| #UD | If CPUID.01H:EDX.CLFSH[bit 19] = 0. If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|--|
| #GP | If any part of the operand lies outside the effective address space from 0 to FFFFH. |
| #UD | If CPUID.01H:EDX.CLFSH[bit 19] = 0. If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

Same exceptions as in real address mode.

| | |
|-----------------|-------------------|
| #PF(fault-code) | For a page fault. |
|-----------------|-------------------|

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #PF(fault-code) | For a page fault. |
| #UD | If CPUID.01H:EDX.CLFSH[bit 19] = 0. If the LOCK prefix is used. |

CLFLUSHOPT—Flush Cache Line Optimized

| Opcode / Instruction | Op/En | 64-bit Mode | Compat/Leg Mode | Description |
|----------------------------------|-------|-------------|-----------------|-----------------------------------|
| NFx 66 0F AE /7 CLFLUSHOPT m8 | M | Valid | Valid | Flushes cache line containing m8. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|-----------|-----------|-----------|
| M | ModRM:r/m (w) | N/A | N/A | N/A |

Description

Invalidates from every level of the cache hierarchy in the cache coherence domain the cache line that contains the linear address specified with the memory operand. If that cache line contains modified data at any level of the cache hierarchy, that data is written back to memory. The source operand is a byte memory location.

The availability of CLFLUSHOPT is indicated by the presence of the CPUID feature flag CLFLUSHOPT (CPUID.(EAX=07H,ECX=0H):EBX[bit 23]). The aligned cache line size affected is also indicated with the CPUID instruction (bits 8 through 15 of the EBX register when the initial value in the EAX register is 1).

The memory attribute of the page containing the affected line has no effect on the behavior of this instruction. It should be noted that processors are free to speculatively fetch and cache data from system memory regions assigned a memory-type allowing for speculative reads (such as, the WB, WC, and WT memory types). PREFETCH/h instructions can be used to provide the processor with hints for this speculative behavior. Because this speculative fetching can occur at any time and is not tied to instruction execution, the CLFLUSH instruction is not ordered with respect to PREFETCH/h instructions or any of the speculative fetching mechanisms (that is, data can be speculatively loaded into a cache line just before, during, or after the execution of a CLFLUSH instruction that references the cache line).

Executions of the CLFLUSHOPT instruction are ordered with respect to fence instructions and to locked read-modify-write instructions; they are also ordered with respect to older writes to the cache line being invalidated. They are not ordered with respect to other executions of CLFLUSHOPT, to executions of CLFLUSH and CLWB, or to younger writes to the cache line being invalidated. Software can use the SFENCE instruction to order an execution of CLFLUSHOPT relative to one of those operations.

The CLFLUSHOPT instruction can be used at all privilege levels and is subject to all permission checking and faults associated with a byte load (and in addition, a CLFLUSHOPT instruction is allowed to flush a linear address in an execute-only segment). Like a load, the CLFLUSHOPT instruction sets the A bit but not the D bit in the page tables.

In some implementations, the CLFLUSHOPT instruction may always cause transactional abort with Transactional Synchronization Extensions (TSX). The CLFLUSHOPT instruction is not expected to be commonly used inside typical transactional regions. However, programmers must not rely on CLFLUSHOPT instruction to force a transactional abort, since whether they cause transactional abort is implementation dependent.

CLFLUSHOPT operation is the same in non-64-bit modes and 64-bit mode.

Operation

Flush_Cache_Line_Optimized(SRC);

Intel C/C++ Compiler Intrinsic Equivalents

CLFLUSHOPT void _mm_clflushopt(void const *p)

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | For an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| #SS(0) | For an illegal address in the SS segment. |
| #PF(fault-code) | For a page fault. |
| #UD | If CPUID.(EAX=07H,ECX=0H):EBX.CLFLUSHOPT[bit 23] = 0. If the LOCK prefix is used. If an instruction prefix F2H or F3H is used. |

Real-Address Mode Exceptions

| | |
|-----|--|
| #GP | If any part of the operand lies outside the effective address space from 0 to FFFFH. |
| #UD | If CPUID.(EAX=07H,ECX=0H):EBX.CLFLUSHOPT[bit 23] = 0. If the LOCK prefix is used. If an instruction prefix F2H or F3H is used. |

CLI—Clear Interrupt Flag

| Opcode | Instruction | Op/En | 64-bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------|-------------|-----------------|--|
| FA | CLI | Z0 | Valid | Valid | Clear interrupt flag; interrupts disabled when interrupt flag cleared. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

In most cases, CLI clears the IF flag in the EFLAGS register and no other flags are affected. Clearing the IF flag causes the processor to ignore maskable external interrupts. The IF flag and the CLI and STI instruction have no effect on the generation of exceptions and NMI interrupts.

Operation is different in two modes defined as follows:

- **PVI mode** (protected-mode virtual interrupts): CR0.PE = 1, EFLAGS.VM = 0, CPL = 3, and CR4.PVI = 1;
- **VME mode** (virtual-8086 mode extensions): CR0.PE = 1, EFLAGS.VM = 1, and CR4.VME = 1.

If IOPL < 3 and either VME mode or PVI mode is active, CLI clears the VIF flag in the EFLAGS register, leaving IF unaffected.

Table 3-7 indicates the action of the CLI instruction depending on the processor operating mode, IOPL, and CPL.

Table 3-7. Decision Table for CLI Results

| Mode | IOPL | CLI Result |
|------------------------------------|----------------|------------|
| Real-address | X ¹ | IF = 0 |
| Protected, not PVI ² | ≥ CPL | IF = 0 |
| | < CPL | #GP fault |
| Protected, PVI ³ | 3 | IF = 0 |
| | 0-2 | VIF = 0 |
| Virtual-8086, not VME ³ | 3 | IF = 0 |
| | 0-2 | #GP fault |
| Virtual-8086, VME ³ | 3 | IF = 0 |
| | 0-2 | VIF = 0 |

NOTES:

1. X = This setting has no effect on instruction operation.

2. For this table, “protected mode” applies whenever CR0.PE = 1 and EFLAGS.VM = 0; it includes compatibility mode and 64-bit mode.

3. PVI mode and virtual-8086 mode each imply CPL = 3.

Operation

```
IF CR0.PE = 0
  THEN IF := 0; (* Reset Interrupt Flag *)
  ELSE
    IF IOPL ≥ CPL (* CPL = 3 if EFLAGS.VM = 1 *)
      THEN IF := 0; (* Reset Interrupt Flag *)
      ELSE
        IF VME mode OR PVI mode
          THEN VIF := 0; (* Reset Virtual Interrupt Flag *)
          ELSE #GP(0);
        FI;
    FI;
FI;
```

Flags Affected

Either the IF flag or the VIF flag is cleared to 0. Other flags are unaffected.

Protected Mode Exceptions

| | |
|--------|---|
| #GP(0) | If CPL is greater than IOPL and PVI mode is not active. If CPL is greater than IOPL and less than 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|-----------------------------|
| #UD | If the LOCK prefix is used. |
|-----|-----------------------------|

Virtual-8086 Mode Exceptions

| | |
|--------|--|
| #GP(0) | If IOPL is less than 3 and VME mode is not active. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

Same exceptions as in protected mode.

CLRSSBSY—Clear Busy Flag in a Supervisor Shadow Stack Token

| Opcode/ Instruction | Op / En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|-----------------------------|------------|------------------------------|--------------------------|--|
| F3 0F AE /6 CLRSSBSY m64 | M | V/V | CET_SS | Clear busy flag in supervisor shadow stack token reference by m64. |

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------|------------------|-----------|-----------|-----------|
| M | N/A | ModRM:r/m (r, w) | N/A | N/A | N/A |

Description

Clear busy flag in supervisor shadow stack token reference by m64. Subsequent to marking the shadow stack as not busy the SSP is loaded with value 0.

Operation

IF (CR4.CET = 0)
THEN #UD; FI;

IF (IA32_S_CET.SH_STK_EN = 0)
THEN #UD; FI;

IF CPL > 0
THEN GP(0); FI;

SSP_LA = Linear_Address(mem operand)

IF SSP_LA not aligned to 8 bytes

THEN #GP(0); FI;

expected_token_value = SSP_LA | BUSY_BIT (* busy bit - bit position 0 - must be set *)

new_token_value = SSP_LA (* Clear the busy bit *)

IF shadow_stack_lock_cmpxchg8b(SSP_LA, new_token_value, expected_token_value) != expected_token_value

invalid_token := 1; FI

(* Set the CF if invalid token was detected *)

RFLAGS.CF = (invalid_token == 1) ? 1 : 0;

RFLAGS.ZF,PF,AF,OF,SF := 0;

SSP := 0

Flags Affected

CF is set if an invalid token was detected, else it is cleared. ZF, PF, AF, OF, and SF are cleared.

Protected Mode Exceptions

| | |
|-----------------|---|
| #UD | If the LOCK prefix is used. If CR4.CET = 0. If IA32_S_CET.SH_STK_EN = 0. |
| #GP(0) | If memory operand linear address not aligned to 8 bytes. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If destination is located in a non-writeable segment. If the DS, ES, FS, or GS register is used to access memory and it contains a NULL segment selector. If CPL is not 0. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |

Real-Address Mode Exceptions

| | |
|-----|--|
| #UD | The CLRSSBSY instruction is not recognized in real-address mode. |
|-----|--|

Virtual-8086 Mode Exceptions

| | |
|-----|--|
| #UD | The CLRSSBSY instruction is not recognized in virtual-8086 mode. |
|-----|--|

Compatibility Mode Exceptions

| | |
|-----------------|---------------------------------------|
| #UD | Same exceptions as in protected mode. |
| #GP(0) | Same exceptions as in protected mode. |
| #PF(fault-code) | If a page fault occurs. |

64-Bit Mode Exceptions

| | |
|-----------------|---|
| #UD | If the LOCK prefix is used. If CR4.CET = 0. If IA32_S_CET.SH_STK_EN = 0. |
| #GP(0) | If memory operand linear address not aligned to 8 bytes. If CPL is not 0. If the memory address is in a non-canonical form. If token is invalid. |
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #PF(fault-code) | If a page fault occurs. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Clears the task-switched (TS) flag in the CR0 register. This instruction is intended for use in operating-system procedures. It is a privileged instruction that can only be executed at a CPL of 0. It is allowed to be executed in real-address mode to allow initialization for protected mode.

The processor sets the TS flag every time a task switch occurs. The flag is used to synchronize the saving of FPU context in multitasking applications. See the description of the TS flag in the section titled “Control Registers” in Chapter 2 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A, for more information about this flag.

CLTS operation is the same in non-64-bit modes and 64-bit mode.

See Chapter 26, “Virtual Machine Control Structures,” of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3C, for more information about the behavior of this instruction in VMX non-root operation.

Operation

CR0.TS[bit 3] := 0;

Flags Affected

The TS flag in CR0 register is cleared.

Protected Mode Exceptions

#GP(0) If the current privilege level is not 0.
#UD If the LOCK prefix is used.

Real-Address Mode Exceptions

#UD If the LOCK prefix is used.

Virtual-8086 Mode Exceptions

#GP(0) CLTS is not recognized in virtual-8086 mode.
#UD If the LOCK prefix is used.

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

#GP(0) If the CPL is greater than 0.
#UD If the LOCK prefix is used.

CLUI—Clear User Interrupt Flag

| Opcode/ Instruction | Op/ En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|------------------------|-----------|------------------------------|-----------------------|--|
| F3 0F 01 EE CLUI | Z0 | V/I | UINTR | Clear user interrupt flag; user interrupts blocked when user interrupt flag cleared. |

Instruction Operand Encoding

| Op/En | Tuple | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A | N/A |

Description

CLUI clears the user interrupt flag (UIF). Its effect takes place immediately: a user interrupt cannot be delivered on the instruction boundary following CLUI.

An execution of CLUI inside a transactional region causes a transactional abort; the abort loads EAX as it would have had it been caused due to an execution of CLI.

Operation

UIF := 0;

Flags Affected

None.

Protected Mode Exceptions

#UD The CLUI instruction is not recognized in protected mode.

Real-Address Mode Exceptions

#UD The CLUI instruction is not recognized in real-address mode.

Virtual-8086 Mode Exceptions

#UD The CLUI instruction is not recognized in virtual-8086 mode.

Compatibility Mode Exceptions

#UD The CLUI instruction is not recognized in compatibility mode.

64-Bit Mode Exceptions

#UD

- If the LOCK prefix is used.
- If executed inside an enclave.
- If CR4.UINTR = 0.
- If CPUID.07H.0H:EDX.UINTR[bit 5] = 0.

CLWB—Cache Line Write Back

| Opcode/ Instruction | Op/ En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|------------------------|-----------|------------------------------|-----------------------|--|
| 66 0F AE /6 CLWB m8 | M | V/V | CLWB | Writes back modified cache line containing m8, and may retain the line in cache hierarchy in non-modified state. |

Instruction Operand Encoding¹

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|-----------|-----------|-----------|
| M | ModRM:r/m (w) | N/A | N/A | N/A |

Description

Writes back to memory the cache line (if modified) that contains the linear address specified with the memory operand from any level of the cache hierarchy in the cache coherence domain. The line may be retained in the cache hierarchy in non-modified state. Retaining the line in the cache hierarchy is a performance optimization (treated as a hint by hardware) to reduce the possibility of cache miss on a subsequent access. Hardware may choose to retain the line at any of the levels in the cache hierarchy, and in some cases, may invalidate the line from the cache hierarchy. The source operand is a byte memory location.

The availability of CLWB instruction is indicated by the presence of the CPUID feature flag CLWB (bit 24 of the EBX register, see “CPUID — CPU Identification” in this chapter). The aligned cache line size affected is also indicated with the CPUID instruction (bits 8 through 15 of the EBX register when the initial value in the EAX register is 1).

The memory attribute of the page containing the affected line has no effect on the behavior of this instruction. It should be noted that processors are free to speculatively fetch and cache data from system memory regions that are assigned a memory-type allowing for speculative reads (such as, the WB, WC, and WT memory types). PREFETCHH instructions can be used to provide the processor with hints for this speculative behavior. Because this speculative fetching can occur at any time and is not tied to instruction execution, the CLWB instruction is not ordered with respect to PREFETCHH instructions or any of the speculative fetching mechanisms (that is, data can be speculatively loaded into a cache line just before, during, or after the execution of a CLWB instruction that references the cache line).

Executions of the CLWB instruction are ordered with respect to fence instructions and to locked read-modify-write instructions; they are also ordered with respect to older writes to the cache line being written back. They are not ordered with respect to other executions of CLWB, to executions of CLFLUSH and CLFLUSHOPT, or to younger writes to the cache line being written back. Software can use the SFENCE instruction to order an execution of CLWB relative to one of those operations.

For usages that require only writing back modified data from cache lines to memory (do not require the line to be invalidated), and expect to subsequently access the data, software is recommended to use CLWB (with appropriate fencing) instead of CLFLUSH or CLFLUSHOPT for improved performance.

The CLWB instruction can be used at all privilege levels and is subject to all permission checking and faults associated with a byte load. Like a load, the CLWB instruction sets the accessed flag but not the dirty flag in the page tables.

In some implementations, the CLWB instruction may always cause transactional abort with Transactional Synchronization Extensions (TSX). CLWB instruction is not expected to be commonly used inside typical transactional regions. However, programmers must not rely on CLWB instruction to force a transactional abort, since whether they cause transactional abort is implementation dependent.

Operation

Cache_Line_Write_Back(m8);

1. The Mod field of the ModR/M byte cannot have value 11B.

Flags Affected

None.

C/C++ Compiler Intrinsic Equivalent

```
CLWB void _mm_clwb(void const *p);
```

Protected Mode Exceptions

| | |
|-----------------|---|
| #UD | If the LOCK prefix is used. If CPUID.(EAX=07H, ECX=0H):EBX.CLWB[bit 24] = 0. |
| #GP(0) | For an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| #SS(0) | For an illegal address in the SS segment. |
| #PF(fault-code) | For a page fault. |

Real-Address Mode Exceptions

| | |
|-----|--|
| #UD | If the LOCK prefix is used. If CPUID.(EAX=07H, ECX=0H):EBX.CLWB[bit 24] = 0. |
| #GP | If any part of the operand lies outside the effective address space from 0 to FFFFH. |

Virtual-8086 Mode Exceptions

Same exceptions as in real address mode.

| | |
|-----------------|-------------------|
| #PF(fault-code) | For a page fault. |
|-----------------|-------------------|

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|---|
| #UD | If the LOCK prefix is used. If CPUID.(EAX=07H, ECX=0H):EBX.CLWB[bit 24] = 0. |
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #PF(fault-code) | For a page fault. |

CMC—Complement Carry Flag

| Opcode | Instruction | Op/En | 64-bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------|-------------|-----------------|---------------------|
| F5 | CMC | Z0 | Valid | Valid | Complement CF flag. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Complements the CF flag in the EFLAGS register. CMC operation is the same in non-64-bit modes and 64-bit mode.

Operation

$EFLAGS.CF[\text{bit } 0] := \text{NOT } EFLAGS.CF[\text{bit } 0];$

Flags Affected

The CF flag contains the complement of its original value. The OF, ZF, SF, AF, and PF flags are unaffected.

Exceptions (All Operating Modes)

#UD If the LOCK prefix is used.

CMOVcc—Conditional Move

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|------------------|--------------------|-------|-------------|-----------------|---|
| OF 47 /r | CMOVA r16, r/m16 | RM | Valid | Valid | Move if above (CF=0 and ZF=0). |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------------|---------------|-----------|-----------|
| RM | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |

Description

Each of the CMOVcc instructions performs a move operation if the status flags in the EFLAGS register (CF, OF, PF, SF, and ZF) are in a specified state (or condition). A condition code (cc) is associated with each instruction to indicate the condition being tested for. If the condition is not satisfied, a move is not performed and execution continues with the instruction following the CMOVcc instruction.

Specifically, CMOVcc loads data from its source operand into a temporary register unconditionally (regardless of the condition code and the status flags in the EFLAGS register). If the condition code associated with the instruction (cc) is satisfied, the data in the temporary register is then copied into the instruction's destination operand.

These instructions can move 16-bit, 32-bit or 64-bit values from memory to a general-purpose register or from one general-purpose register to another. Conditional moves of 8-bit register operands are not supported.

The condition for each CMOVcc mnemonic is given in the description column of the above table. The terms “less” and “greater” are used for comparisons of signed integers and the terms “above” and “below” are used for unsigned integers.

Because a particular state of the status flags can sometimes be interpreted in two ways, two mnemonics are defined for some opcodes. For example, the CMOVA (conditional move if above) instruction and the CMOVNBE (conditional move if not below or equal) instruction are alternate mnemonics for the opcode 0F 47H.

The CMOVcc instructions were introduced in P6 family processors; however, these instructions may not be supported by all IA-32 processors. Software can determine if the CMOVcc instructions are supported by checking the processor's feature information with the CPUID instruction (see “CPUID—CPU Identification” in this chapter).

In 64-bit mode, the instruction's default operation size is 32 bits. Use of the REX.R prefix permits access to additional registers (R8-R15). Use of the REX.W prefix promotes operation to 64 bits. See the summary chart at the beginning of this section for encoding data and limits.

Operation

temp := SRC

IF condition TRUE

THEN DEST := temp;

ELSE IF (OperandSize = 32 and IA-32e mode active)

THEN DEST[63:32] := 0;

FI;

Flags Affected

None.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

CMP—Compare Two Operands

NOTES:

1. With a REX prefix in 64-bit mode, attempts to access AH, BH, CH, or DH will instead access SPL, DIL, BPL, or SIL, respectively.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-------------------|---------------|-----------|-----------|
| RM | ModRM:reg (r) | ModRM:r/m (r) | N/A | N/A |
| MR | ModRM:r/m (r) | ModRM:reg (r) | N/A | N/A |
| MI | ModRM:r/m (r) | imm8/16/32 | N/A | N/A |
| I | AL/AX/EAX/RAX (r) | imm8/16/32 | N/A | N/A |

Description

Compares the first source operand with the second source operand and sets the status flags in the EFLAGS register according to the results. The comparison is performed by subtracting the second operand from the first operand and then setting the status flags in the same manner as the SUB instruction. When an immediate value is used as an operand, it is sign-extended to the length of the first operand.

The condition codes used by the Jcc, CMOVcc, and SETcc instructions are based on the results of a CMP instruction. Appendix B, “EFLAGS Condition Codes,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1, shows the relationship of the status flags and the condition codes.

In 64-bit mode, the instruction’s default operation size is 32 bits. Use of the REX.R prefix permits access to additional registers (R8-R15). Use of the REX.W prefix promotes operation to 64 bits. See the summary chart at the beginning of this section for encoding data and limits.

Operation

temp := SRC1 – SignExtend(SRC2);
ModifyStatusFlags; (* Modify status flags in the same manner as the SUB instruction*)

Flags Affected

The CF, OF, SF, ZF, AF, and PF flags are set according to the result.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Instruction Operand Encoding¹

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------|------------------|------------------|--------------|-----------|
| A | N/A | ModRM:r/m (r, w) | ModRM:reg (r, w) | VEX.vvvv (r) | N/A |

Description

This instruction compares the value from memory with the value of the second operand. If the specified condition is met, then the processor will add the third operand to the memory operand and write it into memory, else the memory is unchanged by this instruction.

This instruction must have MODRM.MOD equal to 0, 1, or 2. The value 3 for MODRM.MOD is reserved and will cause an invalid opcode exception (#UD).

The second operand is always updated with the original value of the memory operand. The EFLAGS conditions are updated from the results of the comparison. The instruction uses an implicit lock. This instruction does not permit the use of an explicit lock prefix.

Operation

CMPCCXADD srcdest1, srcdest2, src3

tmp1 := load lock srcdest1

tmp2 := tmp1 + src3

EFLAGS.CS,OF,SF,ZF,AF,PF := CMP tmp1, srcdest2

IF <condition>:

srcdest1 := store unlock tmp2

ELSE

srcdest1 := store unlock tmp1

srcdest2 := tmp1

¹. ModRM.MOD != 011B

Flags Affected

The EFLAGS conditions are updated from the results of the comparison.

Intel C/C++ Compiler Intrinsic Equivalent

```
CMPCCXADD int _cmpccxadd_epi32 (void* __A, int __B, int __C, const int __D);  
CMPCCXADD __int64 _cmpccxadd_epi64 (void* __A, __int64 __B, __int64 __C, const int __D);
```

SIMD Floating-Point Exceptions

None.

Exceptions

Exceptions Type 14; see Table 2-31.

CMPPD—Compare Packed Double Precision Floating-Point Values

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------|------------------|---------------|---------------|-----------|
| A | N/A | ModRM:reg (r, w) | ModRM:r/m (r) | imm8 | N/A |
| B | N/A | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | imm8 |
| C | Full | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | imm8 |

Description

Performs a SIMD compare of the packed double precision floating-point values in the second source operand and the first source operand and returns the result of the comparison to the destination operand. The comparison predicate operand (immediate byte) specifies the type of comparison performed on each pair of packed values in the two source operands.

EVEX encoded versions: The first source operand (second operand) is a ZMM/YMM/XMM register. The second source operand can be a ZMM/YMM/XMM register, a 512/256/128-bit memory location or a 512/256/128-bit vector broadcasted from a 64-bit memory location. The destination operand (first operand) is an opmask register. Comparison results are written to the destination operand under the writemask k2. Each comparison result is a single mask bit of 1 (comparison true) or 0 (comparison false).

VEX.256 encoded version: The first source operand (second operand) is a YMM register. The second source operand (third operand) can be a YMM register or a 256-bit memory location. The destination operand (first operand) is a YMM register. Four comparisons are performed with results written to the destination operand. The result of each comparison is a quadword mask of all 1s (comparison true) or all 0s (comparison false).

128-bit Legacy SSE version: The first source and destination operand (first operand) is an XMM register. The second source operand (second operand) can be an XMM register or 128-bit memory location. Bits (MAXVL-1:128) of the corresponding ZMM destination register remain unchanged. Two comparisons are performed with results

written to bits 127:0 of the destination operand. The result of each comparison is a quadword mask of all 1s (comparison true) or all 0s (comparison false).

VEX.128 encoded version: The first source operand (second operand) is an XMM register. The second source operand (third operand) can be an XMM register or a 128-bit memory location. Bits (MAXVL-1:128) of the destination ZMM register are zeroed. Two comparisons are performed with results written to bits 127:0 of the destination operand.

The comparison predicate operand is an 8-bit immediate:

- For instructions encoded using the VEX or EVEX prefix, bits 4:0 define the type of comparison to be performed (see Table 3-8). Bits 5 through 7 of the immediate are reserved.
- For instruction encodings that do not use VEX prefix, bits 2:0 define the type of comparison to be made (see the first 8 rows of Table 3-8). Bits 3 through 7 of the immediate are reserved.

Table 3-8. Comparison Predicate for CMPPD and CMPPS Instructions

| Predicate | imm8 Value | Description | Result: A Is 1st Operand, B Is 2nd Operand | | | | Signals #IA on QNAN |

Table 3-8. Comparison Predicate for CMPPD and CMPPS Instructions (Contd.)

| Predicate | imm8 Value | Description | Result: A Is 1st Operand, B Is 2nd Operand | | | | Signals #IA on QNaN |
|-----------|------------|--|--|-------|-------|------------------------|---------------------|
| | | | A > B | A < B | A = B | Unordered ¹ | |
| NGE_UQ | 19H | Not-greater-than-or-equal (unordered, non-signaling) | False | True | False | True | No |
| NGT_UQ | 1AH | Not-greater-than (unordered, nonsignaling) | False | True | True | True | No |
| FALSE_OS | 1BH | False (ordered, signaling) | False | False | False | False | Yes |
| NEQ_OS | 1CH | Not-equal (ordered, signaling) | True | True | False | False | Yes |
| GE_OQ | 1DH | Greater-than-or-equal (ordered, nonsignaling) | True | False | True | False | No |
| GT_OQ | 1EH | Greater-than (ordered, nonsignaling) | True | False | False | False | No |
| TRUE_US | 1FH | True (unordered, signaling) | True | True | True | True | Yes |

NOTES:

1. If either operand A or B is a NaN.

The unordered relationship is true when at least one of the two source operands being compared is a NaN; the ordered relationship is true when neither source operand is a NaN.

A subsequent computational instruction that uses the mask result in the destination operand as an input operand will not generate an exception, because a mask of all 0s corresponds to a floating-point value of +0.0 and a mask of all 1s corresponds to a QNaN.

Note that processors with “CPUID.1H:ECX.AVX =0” do not implement the “greater-than”, “greater-than-or-equal”, “not-greater than”, and “not-greater-than-or-equal relations” predicates. These comparisons can be made either by using the inverse relationship (that is, use the “not-less-than-or-equal” to make a “greater-than” comparison) or by using software emulation. When using software emulation, the program must swap the operands (copying registers when necessary to protect the data that will now be in the destination), and then perform the compare using a different predicate.

Compilers and assemblers may implement the following two-operand pseudo-ops in addition to the three-operand CMPPD instruction, for processors with “CPUID.1H:ECX.AVX =0”. See Table 3-9. The compiler should treat reserved imm8 values as illegal syntax.

Table 3-9. Pseudo-Op and CMPPD Implementation

| Pseudo-Op | CMPPD Implementation |
|-----------------------|----------------------|
| CMPEQPD xmm1, xmm2 | CMPPD xmm1, xmm2, 0 |
| CMPLTPD xmm1, xmm2 | CMPPD xmm1, xmm2, 1 |
| CMPLEPD xmm1, xmm2 | CMPPD xmm1, xmm2, 2 |
| CMPUNORDPD xmm1, xmm2 | CMPPD xmm1, xmm2, 3 |
| CMPNEQPD xmm1, xmm2 | CMPPD xmm1, xmm2, 4 |
| CMPNLTPD xmm1, xmm2 | CMPPD xmm1, xmm2, 5 |
| CMPNLEPD xmm1, xmm2 | CMPPD xmm1, xmm2, 6 |
| CMPORDPD xmm1, xmm2 | CMPPD xmm1, xmm2, 7 |

The greater-than relations that the processor does not implement require more than one instruction to emulate in software and therefore should not be implemented as pseudo-ops. (For these, the programmer should reverse the operands of the corresponding less than relations and use move instructions to ensure that the mask is moved to the correct destination register and that the source operand is left intact.)

Processors with “CPUID.1H:ECX.AVX =1” implement the full complement of 32 predicates shown in Table 3-10, software emulation is no longer needed. Compilers and assemblers may implement the following three-operand

pseudo-ops in addition to the four-operand VCMPPD instruction. See Table 3-10, where the notations of reg1 reg2, and reg3 represent either XMM registers or YMM registers. The compiler should treat reserved imm8 values as illegal syntax. Alternately, intrinsics can map the pseudo-ops to pre-defined constants to support a simpler intrinsic interface. Compilers and assemblers may implement three-operand pseudo-ops for EVEX encoded VCMPPD instructions in a similar fashion by extending the syntax listed in Table 3-10.

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------|------------------|---------------|---------------|-----------|
| A | N/A | ModRM:reg (r, w) | ModRM:r/m (r) | imm8 | N/A |
| B | N/A | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | imm8 |
| C | Full | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | imm8 |

Description

Performs a SIMD compare of the packed single precision floating-point values in the second source operand and the first source operand and returns the result of the comparison to the destination operand. The comparison predicate operand (immediate byte) specifies the type of comparison performed on each of the pairs of packed values.

EVEX encoded versions: The first source operand (second operand) is a ZMM/YMM/XMM register. The second source operand can be a ZMM/YMM/XMM register, a 512/256/128-bit memory location or a 512/256/128-bit vector broadcasted from a 32-bit memory location. The destination operand (first operand) is an opmask register. Comparison results are written to the destination operand under the writemask k2. Each comparison result is a single mask bit of 1 (comparison true) or 0 (comparison false).

VEX.256 encoded version: The first source operand (second operand) is a YMM register. The second source operand (third operand) can be a YMM register or a 256-bit memory location. The destination operand (first operand) is a YMM register. Eight comparisons are performed with results written to the destination operand. The result of each comparison is a doubleword mask of all 1s (comparison true) or all 0s (comparison false).

128-bit Legacy SSE version: The first source and destination operand (first operand) is an XMM register. The second source operand (second operand) can be an XMM register or 128-bit memory location. Bits (MAXVL-1:128) of the corresponding ZMM destination register remain unchanged. Four comparisons are performed with results written to bits 127:0 of the destination operand. The result of each comparison is a doubleword mask of all 1s (comparison true) or all 0s (comparison false).

VEX.128 encoded version: The first source operand (second operand) is an XMM register. The second source operand (third operand) can be an XMM register or a 128-bit memory location. Bits (MAXVL-1:128) of the destination ZMM register are zeroed. Four comparisons are performed with results written to bits 127:0 of the destination operand.

The comparison predicate operand is an 8-bit immediate:

- For instructions encoded using the VEX prefix and EVEX prefix, bits 4:0 define the type of comparison to be performed (see Table 3-8). Bits 5 through 7 of the immediate are reserved.
- For instruction encodings that do not use VEX prefix, bits 2:0 define the type of comparison to be made (see the first 8 rows of Table 3-8). Bits 3 through 7 of the immediate are reserved.

The unordered relationship is true when at least one of the two source operands being compared is a NaN; the ordered relationship is true when neither source operand is a NaN.

A subsequent computational instruction that uses the mask result in the destination operand as an input operand will not generate an exception, because a mask of all 0s corresponds to a floating-point value of +0.0 and a mask of all 1s corresponds to a QNaN.

Note that processors with "CPUID.1H:ECX.AVX =0" do not implement the "greater-than", "greater-than-or-equal", "not-greater than", and "not-greater-than-or-equal relations" predicates. These comparisons can be made either by using the inverse relationship (that is, use the "not-less-than-or-equal" to make a "greater-than" comparison) or by using software emulation. When using software emulation, the program must swap the operands (copying registers when necessary to protect the data that will now be in the destination), and then perform the compare using a different predicate.

Compilers and assemblers may implement the following two-operand pseudo-ops in addition to the three-operand CMPPS instruction, for processors with "CPUID.1H:ECX.AVX =0". See Table 3-11. The compiler should treat reserved imm8 values as illegal syntax.

Table 3-11. Pseudo-Op and CMPPS Implementation

| Pseudo-Op | CMPPS Implementation |
|-----------------------|----------------------|
| CMPEQPS xmm1, xmm2 | CMPPS xmm1, xmm2, 0 |
| CMPLTPS xmm1, xmm2 | CMPPS xmm1, xmm2, 1 |
| CMPLEPS xmm1, xmm2 | CMPPS xmm1, xmm2, 2 |
| CMPUNORDPS xmm1, xmm2 | CMPPS xmm1, xmm2, 3 |
| CMPNEQPS xmm1, xmm2 | CMPPS xmm1, xmm2, 4 |
| CMPNLTPS xmm1, xmm2 | CMPPS xmm1, xmm2, 5 |
| CMPNLEPS xmm1, xmm2 | CMPPS xmm1, xmm2, 6 |
| CMPORDPS xmm1, xmm2 | CMPPS xmm1, xmm2, 7 |

The greater-than relations that the processor does not implement require more than one instruction to emulate in software and therefore should not be implemented as pseudo-ops. (For these, the programmer should reverse the operands of the corresponding less than relations and use move instructions to ensure that the mask is moved to the correct destination register and that the source operand is left intact.)

Processors with "CPUID.1H:ECX.AVX =1" implement the full complement of 32 predicates shown in Table 3-12, software emulation is no longer needed. Compilers and assemblers may implement the following three-operand pseudo-ops in addition to the four-operand VCMPPS instruction. See Table 3-12, where the notation of reg1 and reg2 represent either XMM registers or YMM registers. The compiler should treat reserved imm8 values as illegal syntax. Alternately, intrinsics can map the pseudo-ops to pre-defined constants to support a simpler intrinsic interface. Compilers and assemblers may implement three-operand pseudo-ops for EVEX encoded VCMPPS instructions in a similar fashion by extending the syntax listed in Table 3-12.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Compares the byte, word, doubleword, or quadword specified with the first source operand with the byte, word, doubleword, or quadword specified with the second source operand and sets the status flags in the EFLAGS register according to the results.

Both source operands are located in memory. The address of the first source operand is read from DS:SI, DS:ESI or RSI (depending on the address-size attribute of the instruction is 16, 32, or 64, respectively). The address of the second source operand is read from ES:DI, ES:EDI or RDI (again depending on the address-size attribute of the instruction is 16, 32, or 64). The DS segment may be overridden with a segment override prefix, but the ES segment cannot be overridden.

At the assembly-code level, two forms of this instruction are allowed: the “explicit-operands” form and the “no-operands” form. The explicit-operands form (specified with the CMPS mnemonic) allows the two source operands to be specified explicitly. Here, the source operands should be symbols that indicate the size and location of the source values. This explicit-operand form is provided to allow documentation. However, note that the documentation provided by this form can be misleading. That is, the source operand symbols must specify the correct type (size) of the operands (bytes, words, or doublewords, quadwords), but they do not have to specify the correct loca-

tion. Locations of the source operands are always specified by the DS:(E)SI (or RSI) and ES:(E)DI (or RDI) registers, which must be loaded correctly before the compare string instruction is executed.

The no-operands form provides “short forms” of the byte, word, and doubleword versions of the CMPS instructions. Here also the DS:(E)SI (or RSI) and ES:(E)DI (or RDI) registers are assumed by the processor to specify the location of the source operands. The size of the source operands is selected with the mnemonic: CMPSB (byte comparison), CMPSW (word comparison), CMPSD (doubleword comparison), or CMPSQ (quadword comparison using REX.W).

After the comparison, the (E/R)SI and (E/R)DI registers increment or decrement automatically according to the setting of the DF flag in the EFLAGS register. (If the DF flag is 0, the (E/R)SI and (E/R)DI register increment; if the DF flag is 1, the registers decrement.) The registers increment or decrement by 1 for byte operations, by 2 for word operations, 4 for doubleword operations. If operand size is 64, RSI and RDI registers increment by 8 for quadword operations.

The CMPS, CMPSB, CMPSW, CMPSD, and CMPSQ instructions can be preceded by the REP prefix for block comparisons. More often, however, these instructions will be used in a LOOP construct that takes some action based on the setting of the status flags before the next comparison is made. See “REP/REPE/REPZ /REPNE/REPNZ—Repeat String Operation Prefix” in Chapter 4 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2B, for a description of the REP prefix.

In 64-bit mode, the instruction’s default address size is 64 bits, 32 bit address size is supported using the prefix 67H. Use of the REX.W prefix promotes doubleword operation to 64 bits (see CMPSQ). See the summary chart at the beginning of this section for encoding data and limits.

Operation

```
temp := SRC1 - SRC2;
```

```
SetStatusFlags(temp);
```

```
IF (64-Bit Mode)
```

```
THEN
```

```

Flags Affected

The CF, OF, SF, ZF, AF, and PF flags are set according to the temporary result of the comparison.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

CMPD—Compare Scalar Double Precision Floating-Point Value

| Opcode/ Instruction | Op / En | 64/32 bit Mode Support | CPUID Feature Flag | Description |

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|------------------|---------------|---------------|-----------|
| A | N/A | ModRM:reg (r, w) | ModRM:r/m (r) | imm8 | N/A |
| B | N/A | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | imm8 |
| C | Tuple1 Scalar | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | imm8 |

Description

Compares the low double precision floating-point values in the second source operand and the first source operand and returns the result of the comparison to the destination operand. The comparison predicate operand (immediate operand) specifies the type of comparison performed.

128-bit Legacy SSE version: The first source and destination operand (first operand) is an XMM register. The second source operand (second operand) can be an XMM register or 64-bit memory location. Bits (MAXVL-1:64) of the corresponding YMM destination register remain unchanged. The comparison result is a quadword mask of all 1s (comparison true) or all 0s (comparison false).

VEX.128 encoded version: The first source operand (second operand) is an XMM register. The second source operand (third operand) can be an XMM register or a 64-bit memory location. The result is stored in the low quadword of the destination operand; the high quadword is filled with the contents of the high quadword of the first source operand. Bits (MAXVL-1:128) of the destination ZMM register are zeroed. The comparison result is a quadword mask of all 1s (comparison true) or all 0s (comparison false).

EVEX encoded version: The first source operand (second operand) is an XMM register. The second source operand can be a XMM register or a 64-bit memory location. The destination operand (first operand) is an opmask register. The comparison result is a single mask bit of 1 (comparison true) or 0 (comparison false), written to the destination starting from the LSB according to the writemask k2. Bits (MAX_KL-1:128) of the destination register are cleared.

The comparison predicate operand is an 8-bit immediate:

- For instructions encoded using the VEX prefix, bits 4:0 define the type of comparison to be performed (see Table 3-8). Bits 5 through 7 of the immediate are reserved.
- For instruction encodings that do not use VEX prefix, bits 2:0 define the type of comparison to be made (see the first 8 rows of Table 3-8). Bits 3 through 7 of the immediate are reserved.

The unordered relationship is true when at least one of the two source operands being compared is a NaN; the ordered relationship is true when neither source operand is a NaN.

A subsequent computational instruction that uses the mask result in the destination operand as an input operand will not generate an exception, because a mask of all 0s corresponds to a floating-point value of +0.0 and a mask of all 1s corresponds to a QNaN.

Note that processors with "CPUID.1H:ECX.AVX =0" do not implement the "greater-than", "greater-than-or-equal", "not-greater than", and "not-greater-than-or-equal relations" predicates. These comparisons can be made either

by using the inverse relationship (that is, use the “not-less-than-or-equal” to make a “greater-than” comparison) or by using software emulation. When using software emulation, the program must swap the operands (copying registers when necessary to protect the data that will now be in the destination), and then perform the compare using a different predicate.

Compilers and assemblers may implement the following two-operand pseudo-ops in addition to the three-operand CMPSD instruction, for processors with “CPUID.1H:ECX.AVX =0”. See Table 3-13. The compiler should treat reserved imm8 values as illegal syntax.

Table 3-13. Pseudo-Op and CMPSD Implementation

| Pseudo-Op | CMPSD Implementation |
|-----------------------|----------------------|
| CMPEQSD xmm1, xmm2 | CMPSD xmm1, xmm2, 0 |
| CMPLTSD xmm1, xmm2 | CMPSD xmm1, xmm2, 1 |
| CMPLESD xmm1, xmm2 | CMPSD xmm1, xmm2, 2 |
| CMPUNORDSD xmm1, xmm2 | CMPSD xmm1, xmm2, 3 |
| CMPNEQSD xmm1, xmm2 | CMPSD xmm1, xmm2, 4 |

The greater-than relations that the processor does not implement require more than one instruction to emulate in software and therefore should not be implemented as pseudo-ops. (For these, the programmer should reverse the operands of the corresponding less than relations and use move instructions to ensure that the mask is moved to the correct destination register and that the source operand is left intact.)

Processors with “CPUID.1H:ECX.AVX =1” implement the full complement of 32 predicates shown in Table 3-14, software emulation is no longer needed. Compilers and assemblers may implement the following three-operand pseudo-ops in addition to the four-operand VCMPSD instruction. See Table 3-14, where the notations of reg1 reg2, and reg3 represent either XMM registers or YMM registers. The compiler should treat reserved imm8 values as illegal syntax. Alternately, intrinsics can map the pseudo-ops to pre-defined constants to support a simpler intrinsic interface. Compilers and assemblers may implement three-operand pseudo-ops for EVEX encoded VCMPSD instructions in a similar fashion by extending the syntax listed in Table 3-14.

CMPSS—Compare Scalar Single Precision Floating-Point Value

| Opcode/ Instruction | Op / En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|---|------------|------------------------------|-----------------------|---|
| F3 0F C2 /r ib CMPSS xmm1, xmm2/m32, imm8 | A | V/V | SSE | Compare low single precision floating-point value in xmm2/m32 and xmm1 using bits 2:0 of imm8 as comparison predicate. |
| VEX.LIG.F3.0F.WIG C2 /r ib VCMPSS xmm1, xmm2, xmm3/m32, imm8 | B | V/V | AVX | Compare low single precision floating-point value in xmm3/m32 and xmm2 using bits 4:0 of imm8 as comparison predicate. |
| EVEX.LLIG.F3.0F.W0 C2 /r ib VCMPSS k1 {k2}, xmm2, xmm3/m32{sae}, imm8 | C | V/V | AVX512F OR AVX10.1 | Compare low single precision floating-point value in xmm3/m32 and xmm2 using bits 4:0 of imm8 as comparison predicate with writemask k2 and leave the result in mask register k1. |

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|------------------|---------------|---------------|-----------|
| A | N/A | ModRM:reg (r, w) | ModRM:r/m (r) | imm8 | N/A |
| B | N/A | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | imm8 |
| C | Tuple1 Scalar | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | imm8 |

Description

Compares the low single precision floating-point values in the second source operand and the first source operand and returns the result of the comparison to the destination operand. The comparison predicate operand (immediate operand) specifies the type of comparison performed.

128-bit Legacy SSE version: The first source and destination operand (first operand) is an XMM register. The second source operand (second operand) can be an XMM register or 32-bit memory location. Bits (MAXVL-1:32) of the corresponding YMM destination register remain unchanged. The comparison result is a doubleword mask of all 1s (comparison true) or all 0s (comparison false).

VEX.128 encoded version: The first source operand (second operand) is an XMM register. The second source operand (third operand) can be an XMM register or a 32-bit memory location. The result is stored in the low 32 bits of the destination operand; bits 127:32 of the destination operand are copied from the first source operand. Bits (MAXVL-1:128) of the destination ZMM register are zeroed. The comparison result is a doubleword mask of all 1s (comparison true) or all 0s (comparison false).

EVEX encoded version: The first source operand (second operand) is an XMM register. The second source operand can be a XMM register or a 32-bit memory location. The destination operand (first operand) is an opmask register. The comparison result is a single mask bit of 1 (comparison true) or 0 (comparison false), written to the destination starting from the LSB according to the writemask k2. Bits (MAX_KL-1:128) of the destination register are cleared.

The comparison predicate operand is an 8-bit immediate:

- For instructions encoded using the VEX prefix, bits 4:0 define the type of comparison to be performed (see Table 3-8). Bits 5 through 7 of the immediate are reserved.
- For instruction encodings that do not use VEX prefix, bits 2:0 define the type of comparison to be made (see the first 8 rows of Table 3-8). Bits 3 through 7 of the immediate are reserved.

The unordered relationship is true when at least one of the two source operands being compared is a NaN; the ordered relationship is true when neither source operand is a NaN.

A subsequent computational instruction that uses the mask result in the destination operand as an input operand will not generate an exception, because a mask of all 0s corresponds to a floating-point value of +0.0 and a mask of all 1s corresponds to a QNaN.

Note that processors with “CPUID.1H:ECX.AVX =0” do not implement the “greater-than”, “greater-than-or-equal”, “not-greater than”, and “not-greater-than-or-equal relations” predicates. These comparisons can be made either by using the inverse relationship (that is, use the “not-less-than-or-equal” to make a “greater-than” comparison) or by using software emulation. When using software emulation, the program must swap the operands (copying registers when necessary to protect the data that will now be in the destination), and then perform the compare using a different predicate.

Compilers and assemblers may implement the following two-operand pseudo-ops in addition to the three-operand CMPSS instruction, for processors with “CPUID.1H:ECX.AVX =0”. See Table 3-15. The compiler should treat reserved imm8 values as illegal syntax.

Table 3-15. Pseudo-Op and CMPSS Implementation

| Pseudo-Op | CMPSS Implementation |
|-----------------------|----------------------|
| CMPEQSS xmm1, xmm2 | CMPSS xmm1, xmm2, 0 |
| CMPLTSS xmm1, xmm2 | CMPSS xmm1, xmm2, 1 |
| CMPLSS xmm1, xmm2 | CMPSS xmm1, xmm2, 2 |
| CMPUNORDSS xmm1, xmm2 | CMPSS xmm1, xmm2, 3 |
| CMPNEQSS xmm1, xmm2 | CMPSS xmm1, xmm2, 4 |
| CMPNLTSS xmm1, xmm2 | CMPSS xmm1, xmm2, 5 |
| CMPNLESS xmm1, xmm2 | CMPSS xmm1, xmm2, 6 |
| CMPORDSS xmm1, xmm2 | CMPSS xmm1, xmm2, 7 |

The greater-than relations that the processor does not implement require more than one instruction to emulate in software and therefore should not be implemented as pseudo-ops. (For these, the programmer should reverse the operands of the corresponding less than relations and use move instructions to ensure that the mask is moved to the correct destination register and that the source operand is left intact.)

Processors with “CPUID.1H:ECX.AVX =1” implement the full complement of 32 predicates shown in Table 3-14, software emulation is no longer needed. Compilers and assemblers may implement the following three-operand pseudo-ops in addition to the four-operand VCMPS instruction. See Table 3-16, where the notations of reg1 reg2, and reg3 represent either XMM registers or YMM registers. The compiler should treat reserved imm8 values as illegal syntax. Alternately, intrinsics can map the pseudo-ops to pre-defined constants to support a simpler intrinsic interface. Compilers and assemblers may implement three-operand pseudo-ops for EVEX encoded VCMPS instructions in a similar fashion by extending the syntax listed in Table 3-16.

Table 3-16. Pseudo-Op and VCMPS Implementation

CMPXCHG—Compare and Exchange

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|-----------------|---|-------|-------------|--------------------|---|
| OF B0/r | CMPXCHG r/m8 ¹ , r8 ¹ | MR | Valid | Valid ² | Compare AL with r/m8. If equal, ZF is set and r8 is loaded into r/m8. Else, clear ZF and load r/m8 into AL. |
| OF B1/r | CMPXCHG r/m16, r16 | MR | Valid | Valid ² | Compare AX with r/m16. If equal, ZF is set and r16 is loaded into r/m16. Else, clear ZF and load r/m16 into AX. |
| OF B1/r | CMPXCHG r/m32, r32 | MR | Valid | Valid ² | Compare EAX with r/m32. If equal, ZF is set and r32 is loaded into r/m32. Else, clear ZF and load r/m32 into EAX. |
| REX.W + OF B1/r | CMPXCHG r/m64, r64 | MR | Valid | N.E. | Compare RAX with r/m64. If equal, ZF is set and r64 is loaded into r/m64. Else, clear ZF and load r/m64 into RAX. |

NOTES:

1. With a REX prefix in 64-bit mode, attempts to access AH, BH, CH, or DH will instead access SPL, DIL, BPL, or SIL, respectively.
2. See the IA-32 Architecture Compatibility section below.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------------|---------------|-----------|-----------|
| MR | ModRM:r/m (r, w) | ModRM:reg (r) | N/A | N/A |

Description

Compares the value in the AL, AX, EAX, or RAX register with the first operand (destination operand). If the two values are equal, the second operand (source operand) is loaded into the destination operand. Otherwise, the destination operand is loaded into the AL, AX, EAX or RAX register. RAX register is available only in 64-bit mode.

This instruction can be used with a LOCK prefix to allow the instruction to be executed atomically. To simplify the interface to the processor's bus, the destination operand receives a write cycle without regard to the result of the comparison. The destination operand is written back if the comparison fails; otherwise, the source operand is written into the destination. (The processor never produces a locked read without also producing a locked write.)

In 64-bit mode, the instruction's default operation size is 32 bits. Use of the REX.R prefix permits access to additional registers (R8-R15). Use of the REX.W prefix promotes operation to 64 bits. See the summary chart at the beginning of this section for encoding data and limits.

IA-32 Architecture Compatibility

This instruction is not supported on Intel processors earlier than the Intel486 processors.

Operation

(* Accumulator = AL, AX, EAX, or RAX depending on whether a byte, word, doubleword, or quadword comparison is being performed *)

TEMP := DEST

IF accumulator = TEMP

THEN

ZF := 1;

DEST := SRC;

ELSE

ZF := 0;

accumulator := TEMP;

DEST := TEMP;

FI;

Flags Affected

The ZF flag is set if the values in the destination operand and register AL, AX, or EAX are equal; otherwise it is cleared. The CF, PF, AF, SF, and OF flags are set according to the results of the comparison operation.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If the destination is located in a non-writable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

CMPXCHG8B/CMPXCHG16B—Compare and Exchange Bytes

| Opcode/ Instruction | Op/ En | 64-Bit Mode | Compat/ Leg Mode | Description |
|-------------------------------------|-----------|----------------|---------------------|--|
| OF C7 /1 CMPXCHG8B m64 | M | Valid | Valid* | Compare EDX:EAX with m64. If equal, set ZF and load ECX:EBX into m64. Else, clear ZF and load m64 into EDX:EAX. |
| REX.W + OF C7 /1 CMPXCHG16B m128 | M | Valid | N.E. | Compare RDX:RAX with m128. If equal, set ZF and load RCX:RBX into m128. Else, clear ZF and load m128 into RDX:RAX. |

NOTES:

*See IA-32 Architecture Compatibility section below.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------------|-----------|-----------|-----------|
| M | ModRM:r/m (r, w) | N/A | N/A | N/A |

Description

Compares the 64-bit value in EDX:EAX (or 128-bit value in RDX:RAX if operand size is 128 bits) with the operand (destination operand). If the values are equal, the 64-bit value in ECX:EBX (or 128-bit value in RCX:RBX) is stored in the destination operand. Otherwise, the value in the destination operand is loaded into EDX:EAX (or RDX:RAX). The destination operand is an 8-byte memory location (or 16-byte memory location if operand size is 128 bits). For the EDX:EAX and ECX:EBX register pairs, EDX and ECX contain the high-order 32 bits and EAX and EBX contain the low-order 32 bits of a 64-bit value. For the RDX:RAX and RCX:RBX register pairs, RDX and RCX contain the high-order 64 bits and RAX and RBX contain the low-order 64bits of a 128-bit value.

This instruction can be used with a LOCK prefix to allow the instruction to be executed atomically. To simplify the interface to the processor's bus, the destination operand receives a write cycle without regard to the result of the comparison. The destination operand is written back if the comparison fails; otherwise, the source operand is written into the destination. (The processor never produces a locked read without also producing a locked write.)

In 64-bit mode, default operation size is 64 bits. Use of the REX.W prefix promotes operation to 128 bits. Note that CMPXCHG16B requires that the destination (memory) operand be 16-byte aligned. See the summary chart at the beginning of this section for encoding data and limits. For information on the CPUID flag that indicates CMPXCHG16B, see page 3-231.

IA-32 Architecture Compatibility

This instruction encoding is not supported on Intel processors earlier than the Pentium processors.

Operation

IF (64-Bit Mode and OperandSize = 64)

THEN

TEMP128 := DEST

IF (RDX:RAX = TEMP128)

THEN

ZF := 1;

DEST := RCX:RBX;

ELSE

ZF := 0;

DEST := TEMP128;

FI;

FI

ELSE

TEMP64 := DEST;

IF (EDX:EAX = TEMP64)

THEN

ZF := 1;

DEST := ECX:EBX;

ELSE

ZF := 0;

EDX:EAX := TEMP64;

DEST := TEMP64;

FI;

FI;

FI;

Flags Affected

The ZF flag is set if the destination operand and EDX:EAX are equal; otherwise it is cleared. The CF, PF, AF, SF, and OF flags are unaffected.

Protected Mode Exceptions

| | |
|-----------------|--|
| #UD | If the destination is not a memory operand. |
| #GP(0) | If the destination is located in a non-writable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #UD | If the destination operand is not a memory location. |
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #UD | If the destination operand is not a memory location. |
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|---|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. If memory operand for CMPXCHG16B is not aligned on a 16-byte boundary. If CPUID.01H:ECX.CMPXCHG16B[bit 13] = 0. |
| #UD | If the destination operand is not a memory location. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |

COMISD—Compare Scalar Ordered Double Precision Floating-Point Values and Set EFLAGS

| Opcode/ Instruction | Op / En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|---|------------|------------------------------|-----------------------|---|
| 66 0F 2F /r COMISD xmm1, xmm2/m64 | A | V/V | SSE2 | Compare low double precision floating-point values in xmm1 and xmm2/mem64 and set the EFLAGS flags accordingly. |
| VEX.LIG.66.0F.WIG 2F /r VCOMISD xmm1, xmm2/m64 | A | V/V | AVX | Compare low double precision floating-point values in xmm1 and xmm2/mem64 and set the EFLAGS flags accordingly. |
| EVEX.LLIG.66.0F.W1 2F /r VCOMISD xmm1, xmm2/m64{sae} | B | V/V | AVX512F OR AVX10.1 | Compare low double precision floating-point values in xmm1 and xmm2/mem64 and set the EFLAGS flags accordingly. |

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|---------------|-----------|-----------|
| A | N/A | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |
| B | Tuple1 Scalar | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Compares the double precision floating-point values in the low quadwords of operand 1 (first operand) and operand 2 (second operand), and sets the ZF, PF, and CF flags in the EFLAGS register according to the result (unordered, greater than, less than, or equal). The OF, SF, and AF flags in the EFLAGS register are set to 0. The unordered result is returned if either source operand is a NaN (QNaN or SNaN).

Operand 1 is an XMM register; operand 2 can be an XMM register or a 64 bit memory location. The COMISD instruction differs from the UCOMISD instruction in that it signals a SIMD floating-point invalid operation exception (#I) when a source operand is either a QNaN or SNaN. The UCOMISD instruction signals an invalid operation exception only if a source operand is an SNaN.

The EFLAGS register is not updated if an unmasked SIMD floating-point exception is generated.

VEX.vvvv and EVEX.vvvv are reserved and must be 1111b, otherwise instructions will #UD.

Software should ensure VCOMISD is encoded with VEX.L=0. Encoding VCOMISD with VEX.L=1 may encounter unpredictable behavior across different processor generations.

Operation

COMISD (All Versions)

```

RESULT := OrderedCompare(DEST[63:0] <> SRC[63:0]) {
(* Set EFLAGS *) CASE (RESULT) OF
    UNORDERED: ZF,PF,CF := 111;
    GREATER_THAN: ZF,PF,CF := 000;
    LESS_THAN: ZF,PF,CF := 001;
    EQUAL: ZF,PF,CF := 100;
ESAC;
OF, AF, SF := 0; }

```

Intel C/C++ Compiler Intrinsic Equivalent

```
VCOMISD int _mm_comi_round_sd(__m128d a, __m128d b, int imm, int sae);  
VCOMISD int _mm_comieq_sd (__m128d a, __m128d b)  
VCOMISD int _mm_comilt_sd (__m128d a, __m128d b)  
VCOMISD int _mm_comile_sd (__m128d a, __m128d b)  
VCOMISD int _mm_comigt_sd (__m128d a, __m128d b)  
VCOMISD int _mm_comige_sd (__m128d a, __m128d b)  
VCOMISD int _mm_comineq_sd (__m128d a, __m128d b)
```

SIMD Floating-Point Exceptions

Invalid (if SNaN or QNaN operands), Denormal.

Other Exceptions

VEX-encoded instructions, see Table 2-20, “Type 3 Class Exception Conditions.”

EVEX-encoded instructions, see Table 2-50, “Type E3NF Class Exception Conditions.”

Additionally:

#UD If VEX.vvvv != 1111B or EVEX.vvvv != 1111B.

COMISS—Compare Scalar Ordered Single Precision Floating-Point Values and Set EFLAGS

| Opcode/ Instruction | Op / En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|--|------------|------------------------------|-----------------------|---|
| NP OF 2F /r COMISS xmm1, xmm2/m32 | A | V/V | SSE | Compare low single precision floating-point values in xmm1 and xmm2/mem32 and set the EFLAGS flags accordingly. |
| VEX.LIG.OF.WIG 2F /r VCOMISS xmm1, xmm2/m32 | A | V/V | AVX | Compare low single precision floating-point values in xmm1 and xmm2/mem32 and set the EFLAGS flags accordingly. |
| EVEX.LLIG.OF.WO 2F /r VCOMISS xmm1, xmm2/m32{sae} | B | V/V | AVX512F OR AVX10.1 | Compare low single precision floating-point values in xmm1 and xmm2/mem32 and set the EFLAGS flags accordingly. |

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|---------------|-----------|-----------|
| A | N/A | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |
| B | Tuple1 Scalar | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Compares the single precision floating-point values in the low quadwords of operand 1 (first operand) and operand 2 (second operand), and sets the ZF, PF, and CF flags in the EFLAGS register according to the result (unordered, greater than, less than, or equal). The OF, SF, and AF flags in the EFLAGS register are set to 0. The unordered result is returned if either source operand is a NaN (QNaN or SNaN).

Operand 1 is an XMM register; operand 2 can be an XMM register or a 32 bit memory location.

The COMISS instruction differs from the UCOMISS instruction in that it signals a SIMD floating-point invalid operation exception (#I) when a source operand is either a QNaN or SNaN. The UCOMISS instruction signals an invalid operation exception only if a source operand is an SNaN.

The EFLAGS register is not updated if an unmasked SIMD floating-point exception is generated.

VEX.vvvv and EVEX.vvvv are reserved and must be 1111b, otherwise instructions will #UD.

Software should ensure VCOMISS is encoded with VEX.L=0. Encoding VCOMISS with VEX.L=1 may encounter unpredictable behavior across different processor generations.

Operation

COMISS (All Versions)

```

RESULT := OrderedCompare(DEST[31:0] <> SRC[31:0]) {
(* Set EFLAGS *) CASE (RESULT) OF
    UNORDERED: ZF,PF,CF := 111;
    GREATER_THAN: ZF,PF,CF := 000;
    LESS_THAN: ZF,PF,CF := 001;
    EQUAL: ZF,PF,CF := 100;
ESAC;
OF, AF, SF := 0; }

```

Intel C/C++ Compiler Intrinsic Equivalent

```
VCOMISS int __mm_comi_round_ss(__m128 a, __m128 b, int imm, int sae);  
VCOMISS int __mm_comieq_ss (__m128 a, __m128 b)  
VCOMISS int __mm_comilt_ss (__m128 a, __m128 b)  
VCOMISS int __mm_comile_ss (__m128 a, __m128 b)  
VCOMISS int __mm_comigt_ss (__m128 a, __m128 b)  
VCOMISS int __mm_comige_ss (__m128 a, __m128 b)  
VCOMISS int __mm_comineq_ss (__m128 a, __m128 b)
```

SIMD Floating-Point Exceptions

Invalid (if SNaN or QNaN operands), Denormal.

Other Exceptions

VEX-encoded instructions, see Table 2-20, “Type 3 Class Exception Conditions.”

EVEX-encoded instructions, see Table 2-50, “Type E3NF Class Exception Conditions.”

Additionally:

#UD If VEX.vvvv != 1111B or EVEX.vvvv != 1111B.

CPUID—CPU Identification

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------|-------------|-----------------|--|
| 0F A2 | CPUID | Z0 | Valid | Valid | Returns processor identification and feature information to the EAX, EBX, ECX, and EDX registers, as determined by input entered in EAX and, in some cases, ECX. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

The ID flag (bit 21) in the EFLAGS register indicates support for the CPUID instruction. If a software procedure can set and clear this flag, the processor executing the procedure supports the CPUID instruction. This instruction operates the same in non-64-bit modes and 64-bit mode.

CPUID returns processor identification and feature information in the EAX, EBX, ECX, and EDX registers.¹ The instruction's output is dependent on the contents of the EAX register upon execution and, in some cases, ECX.

Table 3-17 provides CPUID leaf information and shows information returned, depending on the initial value loaded into the EAX and ECX registers.

Two types of information are returned: basic and extended function information. If a value entered for CPUID.EAX is higher than the maximum input value for basic or extended function for that processor then the data for the highest basic information leaf is returned. For example, using some Intel processors, the following is true:

CPUID.EAX = 05H (* Returns MONITOR/MWAIT leaf. *)
CPUID.EAX = 0AH (* Returns Architectural Performance Monitoring leaf. *)
CPUID.EAX = 0BH (* Returns Extended Topology Enumeration leaf. *)²
CPUID.EAX = 1FH (* Returns V2 Extended Topology Enumeration leaf. *)²
CPUID.EAX = 80000008H (* Returns linear/physical address size data. *)
CPUID.EAX = 8000000AH (* INVALID: Returns same information as CPUID.EAX = 0BH. *)

If a value entered for CPUID.EAX is less than or equal to the maximum input value and the leaf is not supported on that processor, then 0 is returned in all the registers.

When CPUID returns the highest basic leaf information as a result of an invalid input EAX value, any dependence on input ECX value in the basic leaf is honored.

CPUID can be executed at any privilege level to serialize instruction execution. Serializing instruction execution guarantees that any modifications to flags, registers, and memory for previous instructions are completed before the next instruction is fetched and executed. Although the CPUID instruction provides serialization, it is not the preferred method on newer processors that support the SERIALIZE instruction. See "Serializing Instructions" in Chapter 10 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A for more details.

Execution of CPUID causes a VM exit when executed in VMX non-root operation. See Chapter 27, "VMX Non-Root Operation," of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C for more details.

See also:

"Caching Translation Information" in Chapter 4, "Linear-Address Pre-Processing," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A.

1. On Intel 64 processors, CPUID clears the high 32 bits of the RAX/RBX/RCX/RDX registers in all modes.
2. CPUID leaf 1FH is a preferred superset to leaf 0BH. Intel recommends first checking for the existence of CPUID leaf 1FH before using leaf 0BH.

Table 3-17. Information Returned by CPUID Instruction

| Initial EAX Value | Information Provided about the Processor | |
|---|--|---|
| Basic CPUID Information | | |
| 0H | EAX EBX ECX EDX | Maximum Input Value for Basic CPUID Information. "Genu" "ntel" "inel" |
| 01H | EAX EBX ECX EDX | Version Information: Type, Family, Model, and Stepping ID (see Figure 3-6). Bits 07-00: Brand Index. Bits 15-08: CLFLUSH line size (Value * 8 = cache line size in bytes; used also by CLFLUSHOPT). Bits 23-16: Maximum number of addressable IDs for logical processors in this physical package*. Bits 31-24: Initial APIC ID**. Feature Information (see Figure 3-7 and Table 3-19). Feature Information (see Figure 3-8 and Table 3-20). NOTES: * The nearest power-of-2 integer that is not smaller than EBX[23:16] is the number of unique initial APIC IDs reserved for addressing different logical processors in a physical package. This field is only valid if CPUID.1.EDX.HTT[bit 28]= 1. ** The 8-bit initial APIC ID in EBX[31:24] is replaced by the 32-bit x2APIC ID, available in Leaf 0BH and Leaf 1FH. |
| 02H | EAX EBX ECX EDX | Cache and TLB Information (see Table 3-21). Cache and TLB Information. Cache and TLB Information. Cache and TLB Information. |
| 03H | EAX EBX ECX EDX | Reserved. Reserved. Bits 00-31 of 96-bit processor serial number. (Available in Pentium III processor only; otherwise, the value in this register is reserved.) Bits 32-63 of 96-bit processor serial number. (Available in Pentium III processor only; otherwise, the value in this register is reserved.) NOTES: Processor serial number (PSN) is not supported in the Pentium 4 processor or later. On all models, use the PSN flag (returned using CPUID) to check for PSN support before accessing the feature. |
| CPUID leaves above 2 and below 80000000H are visible only when IA32_MISC_ENABLE[bit 22] has its default value of 0. | | |
| Deterministic Cache Parameters Leaf (Initial EAX Value = 04H) | | |
| 04H | EAX | NOTES: Leaf 04H output depends on the initial value in ECX.* See also: "INPUT EAX = 04H: Returns Deterministic Cache Parameters for Each Level" on page 238. Bits 04-00: Cache Type Field. 0 = Null - No more caches. 1 = Data Cache. 2 = Instruction Cache. 3 = Unified Cache. 4-31 = Reserved. |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | | Information Provided about the Processor |
|---|-----|--|
| | | <p>Bits 07-05: Cache Level (starts at 1). Bit 08: Self Initializing cache level (does not need SW initialization). Bit 09: Fully Associative cache.</p> <p>Bits 13-10: Reserved. Bits 25-14: Maximum number of addressable IDs for logical processors sharing this cache**, ***. Bits 31-26: Maximum number of addressable IDs for processor cores in the physical package**, ****, *****.</p> <p>EBX Bits 11-00: L = System Coherency Line Size**. Bits 21-12: P = Physical Line partitions**. Bits 31-22: W = Ways of associativity**.</p> <p>ECX Bits 31-00: S = Number of Sets**.</p> <p>EDX Bit 00: Write-Back Invalidate/Invalidate. 0 = WBINVD/INVD from threads sharing this cache acts upon lower level caches for threads sharing this cache. 1 = WBINVD/INVD is not guaranteed to act upon lower level caches of non-originating threads sharing this cache.</p> <p>Bit 01: Cache Inclusiveness. 0 = Cache is not inclusive of lower cache levels. 1 = Cache is inclusive of lower cache levels.</p> <p>Bit 02: Complex Cache Indexing. 0 = Direct mapped cache. 1 = A complex function is used to index the cache, potentially using all address bits.</p> <p>Bits 31-03: Reserved = 0.</p> <p>NOTES:</p> <p>* If ECX contains an invalid sub leaf index, EAX/EBX/ECX/EDX return 0. Sub-leaf index n+1 is invalid if sub-leaf n returns EAX[4:0] as 0.</p> <p>** Add one to the return value to get the result.</p> <p>***The nearest power-of-2 integer that is not smaller than (1 + EAX[25:14]) is the number of unique initial APIC IDs reserved for addressing different logical processors sharing this cache.</p> <p>**** The nearest power-of-2 integer that is not smaller than (1 + EAX[31:26]) is the number of unique Core_IDs reserved for addressing different processor cores in a physical package. Core ID is a subset of bits of the initial APIC ID.</p> <p>***** The returned value is constant for valid initial values in ECX. Valid ECX values start from 0.</p> |
| MONITOR/MWAIT Leaf (Initial EAX Value = 05H) | | |
| 05H | EAX | <p>Bits 15-00: Smallest monitor-line size in bytes (default is processor's monitor granularity). Bits 31-16: Reserved = 0.</p> |
| | EBX | <p>Bits 15-00: Largest monitor-line size in bytes (default is processor's monitor granularity). Bits 31-16: Reserved = 0.</p> |
| | ECX | <p>Bit 00: Enumeration of Monitor-Mwait extensions (beyond EAX and EBX registers) supported. Bit 01: Supports treating interrupts as break-event for MWAIT, even when interrupts disabled. Bits 31-02: Reserved.</p> |
| | EDX | <p>Bits 03-00: Number of C0* sub C-states supported using MWAIT. Bits 07-04: Number of C1* sub C-states supported using MWAIT. Bits 11-08: Number of C2* sub C-states supported using MWAIT. Bits 15-12: Number of C3* sub C-states supported using MWAIT. Bits 19-16: Number of C4* sub C-states supported using MWAIT. Bits 23-20: Number of C5* sub C-states supported using MWAIT. Bits 27-24: Number of C6* sub C-states supported using MWAIT. Bits 31-28: Number of C7* sub C-states supported using MWAIT.</p> |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor | |
|---|--|---|
| | NOTE: * The definition of C0 through C7 states for MWAIT extension are processor-specific C-states, not ACPI C-states. | |
| Thermal and Power Management Leaf (Initial EAX Value = 06H) | | |
| 06H | EAX | Bit 00: Digital temperature sensor is supported if set. Bit 01: Intel Turbo Boost Technology available (see description of IA32_MISC_ENABLE[38]). Bit 02: ARAT. APIC-Timer-always-running feature is supported if set. Bit 03: Reserved. Bit 04: PLN. Power limit notification controls are supported if set. Bit 05: ECMD. Clock modulation duty cycle extension is supported if set. Bit 06: PTM. Package thermal management is supported if set. Bit 07: HWP. HWP base registers (IA32_PM_ENABLE[bit 0], IA32_HWP_CAPABILITIES, IA32_HWP_REQUEST, IA32_HWP_STATUS) are supported if set. Bit 08: HWP_Notification. IA32_HWP_INTERRUPT MSR is supported if set. Bit 09: HWP_Activity_Window. IA32_HWP_REQUEST[bits 41:32] is supported if set. Bit 10: HWP_Energy_Performance_Preference. IA32_HWP_REQUEST[bits 31:24] is supported if set. Bit 11: HWP_Package_Level_Request. IA32_HWP_REQUEST_PKG MSR is supported if set. Bit 12: Reserved. Bit 13: HDC. HDC base registers IA32_PKG_HDC_CTL, IA32_PM_CTL1, IA32_THREAD_STALL MSRs are supported if set. Bit 14: Intel® Turbo Boost Max Technology 3.0 available. Bit 15: HWP Capabilities. Highest Performance change is supported if set. Bit 16: HWP PECL override is supported if set. Bit 17: Flexible HWP is supported if set. Bit 18: Fast access mode, low latency, and posted IA32_HWP_REQUEST MSR are supported if set. Bit 19: HW_FEEDBACK. IA32_HW_FEEDBACK_PTR MSR, IA32_HW_FEEDBACK_CONFIG MSR, IA32_PACKAGE_THERM_STATUS MSR bit 26, and IA32_PACKAGE_THERM_INTERRUPT MSR bit 25 are supported if set. Bit 20: Ignoring Idle Logical Processor HWP request is supported if set. Bit 21: Reserved. Bit 22: HWP Control MSR Support. The IA32_HWP_CTL MSR is supported if set. Bit 23: Intel® Thread Director supported if set. The IA32_HW_FEEDBACK_CHAR and IA32_HW_FEEDBACK_THREAD_CONFIG MSRs are supported if set. Bits 31-24: Reserved. |
| | EBX | Bits 03-00: Number of Interrupt Thresholds in Digital Thermal Sensor. Bits 31-04: Reserved. |
| | ECX | Bit 00: Hardware Coordination Feedback Capability (Presence of IA32_MPERF and IA32_APERF). The capability to provide a measure of delivered processor performance (since last reset of the counters), as a percentage of the expected processor performance when running at the TSC frequency. Bits 02-01: Reserved = 0. Bit 03: The processor supports performance-energy bias preference if CPUID.06H:ECX.SETBH[bit 3] is set and it also implies the presence of a new architectural MSR called IA32_ENERGY_PERF_BIAS (1BOH). Bits 07-04: Reserved = 0. Bits 15-08: Number of Intel® Thread Director classes supported by the processor. Information for that many classes is written into the Intel Thread Director Table by the hardware. Bits 31-16: Reserved = 0. |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor | |
|--|--|--|
| | <p>EDX</p> <p>Bits 07-00: Bitmap of supported hardware feedback interface capabilities. 0 = When set to 1, indicates support for performance capability reporting. 1 = When set to 1, indicates support for energy efficiency capability reporting. 2-7 = Reserved</p> <p>Bits 11-08: Enumerates the size of the hardware feedback interface structure in number of 4 KB pages; add one to the return value to get the result.</p> <p>Bits 31-16: Index (starting at 0) of this logical processor's row in the hardware feedback interface structure. Note that on some parts the index may be same for multiple logical processors. On some parts the indices may not be contiguous, i.e., there may be unused rows in the hardware feedback interface structure.</p> <p>NOTE: Bits 0 and 1 will always be set together.</p> | |
| <i>Structured Extended Feature Flags Enumeration Leaf (Initial EAX Value = 07H, ECX = 0)</i> | | |
| 07H | <p>EAX</p> <p>EBX</p> <p>Bits 31-00: Reports the maximum input value for supported leaf 7 sub-leaves.</p> <p>Bit 00: FSGSBASE. Supports RDFSBASE/RDGSBASE/WRFSBASE/WRGSBASE if 1.</p> <p>Bit 01: IA32_TSC_ADJUST MSR is supported if 1.</p> <p>Bit 02: SGX. Supports Intel® Software Guard Extensions (Intel® SGX Extensions) if 1.</p> <p>Bit 03: BMI1.</p> <p>Bit 04: HLE.</p> <p>Bit 05: AVX2. Supports Intel® Advanced Vector Extensions 2 (Intel® AVX2) if 1.</p> <p>Bit 06: FDP_EXCPTN_ONLY. x87 FPU Data Pointer updated only on x87 exceptions if 1.</p> <p>Bit 07: SMEP. Supports Supervisor-Mode Execution Prevention if 1.</p> <p>Bit 08: BMI2.</p> <p>Bit 09: Supports Enhanced REP MOVSB/STOSB if 1.</p> <p>Bit 10: INVPCID. If 1, supports INVPCID instruction for system software that manages process-context identifiers.</p> <p>Bit 11: RTM.</p> <p>Bit 12: RDT-M. Supports Intel® Resource Director Technology (Intel® RDT) Monitoring capability if 1.</p> <p>Bit 13: Deprecates FPU CS and FPU DS values if 1.</p> <p>Bit 14: MPX. Supports Intel® Memory Protection Extensions if 1.</p> <p>Bit 15: RDT-A. Supports Intel® Resource Director Technology (Intel® RDT) Allocation capability if 1.</p> <p>Bit 16: AVX512F.</p> <p>Bit 17: AVX512DQ.</p> <p>Bit 18: RDSEED.</p> <p>Bit 19: ADX.</p> <p>Bit 20: SMAP. Supports Supervisor-Mode Access Prevention (and the CLAC/STAC instructions) if 1.</p> <p>Bit 21: AVX512_IFMA.</p> <p>Bit 22: Reserved.</p> <p>Bit 23: CLFLUSHOPT.</p> <p>Bit 24: CLWB.</p> <p>Bit 25: Intel Processor Trace.</p> <p>Bit 26: AVX512PF. (Intel® Xeon Phi™ only.)</p> <p>Bit 27: AVX512ER. (Intel® Xeon Phi™ only.)</p> <p>Bit 28: AVX512CD.</p> <p>Bit 29: SHA. supports Intel® Secure Hash Algorithm Extensions (Intel® SHA Extensions) if 1.</p> <p>Bit 30: AVX512BW.</p> <p>Bit 31: AVX512VL.</p> | |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor |
|-------------------|---|
| ECX | <p>Bit 00: PREFETCHWT1. (Intel® Xeon Phi™ only.)</p> <p>Bit 01: AVX512_VBMI.</p> <p>Bit 02: UMIP. Supports user-mode instruction prevention if 1.</p> <p>Bit 03: PKU. Supports protection keys for user-mode pages if 1.</p> <p>Bit 04: OSPKE. If 1, OS has set CR4.PKE to enable protection keys (and the RDPKRU/WRPKRU instructions).</p> <p>Bit 05: WAITPKG.</p> <p>Bit 06: AVX512_VBMI2.</p> <p>Bit 07: CET_SS. Supports CET shadow stack features if 1. Processors that set this bit define bits 1:0 of the IA32_U_CET and IA32_S_CET MSRs. Enumerates support for the following MSRs: IA32_INTERRUPT_SP-P_TABLE_ADDR, IA32_PL3_SSP, IA32_PL2_SSP, IA32_PL1_SSP, and IA32_PL0_SSP.</p> <p>Bit 08: GFNI.</p> <p>Bit 09: VAES.</p> <p>Bit 10: VPCLMULQDQ.</p> <p>Bit 11: AVX512_VNNI.</p> <p>Bit 12: AVX512_BITALG.</p> <p>Bits 13: TME_EN. If 1, the following MSRs are supported: IA32_TME_CAPABILITY, IA32_TME_ACTIVATE, IA32_TME_EXCLUDE_MASK, and IA32_TME_EXCLUDE_BASE.</p> <p>Bit 14: AVX512_VPOPCNTDQ.</p> <p>Bit 15: Reserved.</p> <p>Bit 16: LA57. Supports 57-bit linear addresses and five-level paging if 1.</p> <p>Bits 21-17: The value of MAWAU used by the BNDLDX and BNDSTX instructions in 64-bit mode.</p> <p>Bit 22: RDPID and IA32_TSC_AUX are available if 1.</p> <p>Bit 23: KL. Supports Key Locker if 1.</p> <p>Bit 24: BUS_LOCK_DETECT. If 1, indicates support for OS bus-lock detection.</p> <p>Bit 25: CLDEMOTE. Supports cache line demote if 1.</p> <p>Bit 26: Reserved.</p> <p>Bit 27: MOVDIRI. Supports MOVDIRI if 1.</p> <p>Bit 28: MOVDIR64B. Supports MOVDIR64B if 1.</p> <p>Bit 29: ENQCMD. Supports Enqueue Stores if 1.</p> <p>Bit 30: SGX_LC. Supports SGX Launch Configuration if 1.</p> <p>Bit 31: PKS. Supports protection keys for supervisor-mode pages if 1.</p> |
| EDX | <p>Bit 00: Reserved.</p> <p>Bit 01: SGX-KEYS. If 1, Attestation Services for Intel® SGX is supported.</p> <p>Bit 02: AVX512_4VNNIW. (Intel® Xeon Phi™ only.)</p> <p>Bit 03: AVX512_4FMAPS. (Intel® Xeon Phi™ only.)</p> <p>Bit 04: Fast Short REP MOVSB.</p> <p>Bit 05: UINTR. If 1, the processor supports user interrupts.</p> <p>Bits 07-06: Reserved.</p> <p>Bit 08: AVX512_VP2INTERSECT.</p> <p>Bit 09: SRBDS_CTRL. If 1, enumerates support for the IA32_MCU_OPT_CTRL MSR and indicates its bit 0 (RNGDS_MITG_DIS) is also supported.</p> <p>Bit 10: MD_CLEAR supported.</p> <p>Bit 11: RTM_ALWAYS_ABORT. If set, any execution of XBEGIN immediately aborts and transitions to the specified fallback address.</p> <p>Bit 12: Reserved.</p> <p>Bit 13: If 1, RTM_FORCE_ABORT supported. Processors that set this bit support the IA32_TSX_FORCE_ABORT MSR. They allow software to set IA32_TSX_FORCE_ABORT[0] (RTM_FORCE_ABORT).</p> <p>Bit 14: SERIALIZE.</p> <p>Bit 15: Hybrid. If 1, the processor is identified as a hybrid part. If CPUID.0.MAXLEAF ≥ 1AH and CPUID.1A.EAX ≠ 0, then the Native Model ID Enumeration Leaf 1AH exists.</p> <p>Bit 16: TSXLDTRK. If 1, the processor supports Intel TSX suspend/resume of load address tracking.</p> |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor |
|--|---|
| | <p>Bit 17: Reserved.</p> <p>Bit 18: PCONFIG. Supports PCONFIG if 1.</p> <p>Bit 19: Architectural LBRs. If 1, indicates support for architectural LBRs.</p> <p>Bit 20: CET_IBT. Supports CET indirect branch tracking features if 1. Processors that set this bit define bits 5:2 and bits 63:10 of the IA32_U_CET and IA32_S_CET MSRs.</p> <p>Bit 21: Reserved.</p> <p>Bit 22: AMX-BF16. If 1, the processor supports tile computational operations on bfloat16 numbers.</p> <p>Bit 23: AVX512-FP16.</p> <p>Bit 24: AMX-TILE. If 1, the processor supports tile architecture.</p> <p>Bits 25: AMX-INT8. If 1, the processor supports tile computational operations on 8-bit integers.</p> <p>Bit 26: Enumerates support for indirect branch restricted speculation (IBRS) and the indirect branch predictor barrier (IBPB). Processors that set this bit support the IA32_SPEC_CTRL MSR and the IA32_PRED_CMD MSR. They allow software to set IA32_SPEC_CTRL[0] (IBRS) and IA32_PRED_CMD[0] (IBPB).</p> <p>Bit 27: Enumerates support for single thread indirect branch predictors (STIBP). Processors that set this bit support the IA32_SPEC_CTRL MSR. They allow software to set IA32_SPEC_CTRL[1] (STIBP).</p> <p>Bit 28: Enumerates support for L1D_FLUSH. Processors that set this bit support the IA32_FLUSH_CMD MSR. They allow software to set IA32_FLUSH_CMD[0] (L1D_FLUSH).</p> <p>Bit 29: Enumerates support for the IA32_ARCH_CAPABILITIES MSR.</p> <p>Bit 30: Enumerates support for the IA32_CORE_CAPABILITIES MSR.</p> <p>IA32_CORE_CAPABILITIES is an architectural MSR that enumerates model-specific features. A bit being set in this MSR indicates that a model specific feature is supported; software must still consult CPUID family/model/stepping to determine the behavior of the enumerated feature as features enumerated in IA32_CORE_CAPABILITIES may have different behavior on different processor models. Some of these features may have behavior that is consistent across processor models (and for which consultation of CPUID family/model/stepping is not necessary); such features are identified explicitly where they are documented in this manual.</p> <p>Bit 31: Enumerates support for Speculative Store Bypass Disable (SSBD). Processors that set this bit support the IA32_SPEC_CTRL MSR. They allow software to set IA32_SPEC_CTRL[2] (SSBD).</p> <p>NOTE:</p> <p>* If ECX contains an invalid sub-leaf index, EAX/EBX/ECX/EDX return 0. Sub-leaf index n is invalid if n exceeds the value that sub-leaf 0 returns in EAX.</p> |
| <i>Structured Extended Feature Enumeration Sub-leaf (Initial EAX Value = 07H, ECX = 1)</i> | |
| 07H | <p>NOTES:</p> <p>Leaf 07H output depends on the initial value in ECX.</p> <p>If ECX contains an invalid sub leaf index, EAX/EBX/ECX/EDX return 0.</p> <p>EAX</p> <p>This field reports 0 if the sub-leaf index, 1, is invalid.</p> <p>Bit 00: SHA512. If 1, supports the SHA512 instructions.</p> <p>Bit 01: SM3. If 1, supports the SM3 instructions.</p> <p>Bit 02: SM4. If 1, supports the SM4 instructions.</p> <p>Bit 03: Reserved.</p> <p>Bit 04: AVX-VNNI. AVX (VEX-encoded) versions of the Vector Neural Network Instructions.</p> <p>Bit 05: AVX512-BF16. Vector Neural Network Instructions supporting BFLOAT16 inputs and conversion instructions from IEEE single precision.</p> <p>Bit 06: LASS. If 1, supports Linear Address Space Separation.</p> <p>Bit 07: CMPCCXADD. If 1, supports the CMPccXADD instruction.</p> <p>Bit 08: ArchPerfMonExt. If 1, supports ArchPerfMonExt. When set, indicates that the Architectural Performance Monitoring Extended Leaf (EAX = 23H) is valid.</p> <p>Bit 09: Reserved.</p> <p>Bit 10: If 1, supports fast zero-length REP MOVSB.</p> <p>Bit 11: If 1, supports fast short REP STOSB.</p> <p>Bit 12: If 1, supports fast short REP CMPSB, REP SCASB.</p> |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor |
|--|--|
| | <p>Bits 18-13: Reserved.</p> <p>Bit 19: WRMSRNS. If 1, supports the WRMSRNS instruction.</p> <p>Bit 20: Reserved.</p> <p>Bit 21: AMX-FP16. If 1, the processor supports tile computational operations on FP16 numbers.</p> <p>Bit 22: HRESET. If 1, supports history reset via the HRESET instruction and the IA32_HRESET_ENABLE MSR. When set, indicates that the Processor History Reset Leaf (EAX = 20H) is valid.</p> <p>Bit 23: AVX-IFMA. If 1, supports the AVX-IFMA instructions.</p> <p>Bits 25-24: Reserved.</p> <p>Bit 26: LAM. If 1, supports Linear Address Masking.</p> <p>Bit 27: MSRLIST. If 1, supports the RDMSRLIST and WRMSRLIST instructions and the IA32_BARRIER MSR.</p> <p>Bits 29-28: Reserved.</p> <p>Bit 30: INVD_DISABLE_POST_BIOS_DONE. If 1, supports INVD execution prevention after BIOS Done.</p> <p>Bit 31: Reserved.</p> |
| EBX | <p>This field reports 0 if the sub-leaf index, 1, is invalid.</p> <p>Bit 00: Enumerates the presence of the IA32_PPIN and IA32_PPIN_CTL MSRs. If 1, these MSRs are supported.</p> <p>Bits 02-01: Reserved.</p> <p>Bit 03: CPUIDMAXVAL_LIM_RMV. If 1, IA32_MISC_ENABLE[bit 22] cannot be set to 1 to limit the value returned by CPUID.00H:EAX[bits 7:0].</p> <p>Bits 31-04: Reserved.</p> |
| ECX | This field reports 0 if the sub-leaf index, 1, is invalid; otherwise it is reserved. |
| EDX | <p>This field reports 0 if the sub-leaf index, 1, is invalid.</p> <p>Bits 03-00: Reserved.</p> <p>Bit 04: AVX-VNNI-INT8. If 1, supports the AVX-VNNI-INT8 instructions.</p> <p>Bit 05: AVX-NE-CONVERT. If 1, supports the AVX-NE-CONVERT instructions.</p> <p>Bits 09-06: Reserved.</p> <p>Bit 10: AVX-VNNI-INT16. If 1, supports the AVX-VNNI-INT16 instructions.</p> <p>Bits 13-11: Reserved.</p> <p>Bit 14: PREFETCHI. If 1, supports the PREFETCHIT0/1 instructions.</p> <p>Bits 16-15: Reserved.</p> <p>Bit 17: UIRET_UIF. If 1, UIRET sets UIF to the value of bit 1 of the RFLAGS image loaded from the stack.</p> <p>Bit 18: CET_SSS. If 1, indicates that an operating system can enable supervisor shadow stacks as long as it ensures that a supervisor shadow stack cannot become prematurely busy due to page faults (see Section 18.2.3 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1). When emulating the CPUID instruction, a virtual-machine monitor (VMM) should return this bit as 1 only if it ensures that VM exits cannot cause a guest supervisor shadow stack to appear to be prematurely busy. Such a VMM could set the "prematurely busy shadow stack" VM-exit control and use the additional information that it provides.</p> <p>Bit 19: AVX10. If 1, supports the Intel® AVX10 instructions and indicates the presence of CPUID Leaf 24H, which enumerates version number and supported vector lengths.</p> <p>Bits 23-20: Reserved.</p> <p>Bit 24: SLSM. If 1, indicates bit 0 of the IA32_INTEGRITY_STATUS MSR is supported. Bit 0 of this MSR indicates whether static lockstep is active on this logical processor.</p> <p>Bits 31-25: Reserved.</p> |
| <i>Structured Extended Feature Enumeration Sub-leaf (Initial EAX Value = 07H, ECX = 2)</i> | |
| 07H | <p>NOTES:</p> <p>Leaf 07H output depends on the initial value in ECX.</p> <p>If ECX contains an invalid sub leaf index, EAX/EBX/ECX/EDX return 0.</p> |
| EAX | This field reports 0 if the sub-leaf index, 2, is invalid; otherwise it is reserved. |
| EBX | This field reports 0 if the sub-leaf index, 2, is invalid; otherwise it is reserved. |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor | |
|---|--|--|
| | ECX | This field reports 0 if the sub-leaf index, 2, is invalid; otherwise it is reserved. |
| | EDX | <p>This field reports 0 if the sub-leaf index, 2, is invalid.</p> <p>Bit 00: PSFD. If 1, indicates bit 7 of the IA32_SPEC_CTRL MSR is supported. Bit 7 of this MSR disables Fast Store Forwarding Predictor without disabling Speculative Store Bypass.</p> <p>Bit 01: IPRED_CTRL. If 1, indicates bits 3 and 4 of the IA32_SPEC_CTRL MSR are supported. Bit 3 of this MSR enables IPRED_DIS control for CPL3. Bit 4 of this MSR enables IPRED_DIS control for CPL0/1/2.</p> <p>Bit 02: RRSBA_CTRL. If 1, indicates bits 5 and 6 of the IA32_SPEC_CTRL MSR are supported. Bit 5 of this MSR disables RRSBA behavior for CPL3. Bit 6 of this MSR disables RRSBA behavior for CPL0/1/2.</p> <p>Bit 03: DDPD_U. If 1, indicates bit 8 of the IA32_SPEC_CTRL MSR is supported. Bit 8 of this MSR disables Data Dependent Prefetcher.</p> <p>Bit 04: BHI_CTRL. If 1, indicates bit 10 of the IA32_SPEC_CTRL MSR is supported. Bit 10 of this MSR enables BHI_DIS_S behavior.</p> <p>Bit 05: MCDT_NO. Processors that enumerate this bit as 1 do not exhibit MXCSR Configuration Dependent Timing (MCDT) behavior and do not need to be mitigated to avoid data-dependent behavior for certain instructions.</p> <p>Bit 06: If 1, supports the UC-lock disable feature and it causes #AC.</p> <p>Bit 07: MONITOR_MITG_NO. If 1, indicates that the MONITOR/UMONITOR instructions are not affected by performance or power issues due to MONITOR/UMONITOR instructions exceeding the capacity of an internal monitor tracking table. If 0, then the product may be affected by this issue.</p> <p>Bits 31-08: Reserved.</p> |
| Direct Cache Access Information Leaf (Initial EAX Value = 09H) | | |
| 09H | EAX | Value of bits [31:0] of IA32_PLATFORM_DCA_CAP MSR (address 1F8H). |
| | EBX | Reserved. |
| | ECX | Reserved. |
| | EDX | Reserved. |
| Architectural Performance Monitoring Leaf (Initial EAX Value = 0AH) | | |
| 0AH | EAX | <p>Bits 07-00: Version ID of architectural performance monitoring.</p> <p>Bits 15-08: Number of general-purpose performance monitoring counter per logical processor.</p> <p>Bits 23-16: Bit width of general-purpose, performance monitoring counter.</p> <p>Bits 31-24: Length of EBX bit vector to enumerate architectural performance monitoring events. Architectural event x is supported if $EBX[x]=0 \ \&\& \ EAX[31:24]>x$.</p> |
| | EBX | <p>Bit 00: Core cycle event not available if 1 or if $EAX[31:24]<1$.</p> <p>Bit 01: Instruction retired event not available if 1 or if $EAX[31:24]<2$.</p> <p>Bit 02: Reference cycles event not available if 1 or if $EAX[31:24]<3$.</p> <p>Bit 03: Last-level cache reference event not available if 1 or if $EAX[31:24]<4$.</p> <p>Bit 04: Last-level cache misses event not available if 1 or if $EAX[31:24]<5$.</p> <p>Bit 05: Branch instruction retired event not available if 1 or if $EAX[31:24]<6$.</p> <p>Bit 06: Branch mispredict retired event not available if 1 or if $EAX[31:24]<7$.</p> <p>Bit 07: Top-down slots event not available if 1 or if $EAX[31:24]<8$.</p> <p>Bits 31-08: Reserved = 0.</p> |
| | ECX | Bits 31-00: Supported fixed counters bit mask. Fixed-function performance counter 'i' is supported if bit 'i' is 1 (first counter index starts at zero). It is recommended to use the following logic to determine if a Fixed Counter is supported: $FxCtr[i]_{is_supported} := ECX[i] \ \ (EDX[4:0] > i)$; ¹ |
| | EDX | <p>Bits 04-00: Number of contiguous fixed-function performance counters starting from 0 (if Version ID > 1).¹</p> <p>Bits 12-05: Bit width of fixed-function performance counters (if Version ID > 1).</p> <p>Bits 14-13: Reserved = 0.</p> <p>Bit 15: AnyThread deprecation.</p> <p>Bits 31-16: Reserved = 0.</p> |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor | | | | | | | | | | |
|---|---|---|------------------|---------------|---|--------|-------------------|---|---------|------|---|
| Extended Topology Enumeration Leaf (Initial EAX Value = 0BH, ECX ≥ 0) | | | | | | | | | | | |
| 0BH | <p>NOTES:</p> <p>CPUID leaf 1FH is a preferred superset to leaf 0BH. Intel recommends first checking for the existence of Leaf 1FH before using leaf 0BH.</p> <p>The sub-leaves of CPUID leaf 0BH describe an ordered hierarchy of logical processors starting from the smallest-scoped domain of a Logical Processor (sub-leaf index 0) to the Core domain (sub-leaf index 1) to the largest-scoped domain (the last valid sub-leaf index) that is implicitly subordinate to the unenumerated highest-scoped domain of the processor package (socket).</p> <p>The details of each valid domain is enumerated by a corresponding sub-leaf. Details for a domain include its type and how all instances of that domain determine the number of logical processors and x2 APIC ID partitioning at the next higher-scoped domain. The ordering of domains within the hierarchy is fixed architecturally as shown below. For a given processor, not all domains may be relevant or enumerated; however, the logical processor and core domains are always enumerated.</p> <p>For two valid sub-leaves N and N+1, sub-leaf N+1 represents the next immediate higher-scoped domain with respect to the domain of sub-leaf N for the given processor.</p> <p>If sub-leaf index “N” returns an invalid domain type in ECX[15:08] (00H), then all sub-leaves with an index greater than “N” shall also return an invalid domain type. A sub-leaf returning an invalid domain always returns 0 in EAX and EBX.</p> | | | | | | | | | | |
| EAX | <p>Bits 04-00: The number of bits that the x2APIC ID must be shifted to the right to address instances of the next higher-scoped domain. When logical processor is not supported by the processor, the value of this field at the Logical Processor domain sub-leaf may be returned as either 0 (no allocated bits in the x2APIC ID) or 1 (one allocated bit in the x2APIC ID); software should plan accordingly.</p> <p>Bits 31-05: Reserved.</p> | | | | | | | | | | |
| EBX | <p>Bits 15-00: The number of logical processors across all instances of this domain within the next higher-scoped domain. (For example, in a processor socket/package comprising “M” dies of “N” cores each, where each core has “L” logical processors, the “die” domain sub-leaf value of this field would be M*N*L.) This number reflects configuration as shipped by Intel. Note, software must not use this field to enumerate processor topology*.</p> <p>Bits 31-16: Reserved.</p> | | | | | | | | | | |
| ECX | <p>Bits 07-00: The input ECX sub-leaf index.</p> <p>Bits 15-08: Domain Type. This field provides an identification value which indicates the domain as shown below. Although domains are ordered, their assigned identification values are not and software should not depend on it.</p> <table><tr><td><u>Hierarchy</u></td><td><u>Domain</u></td><td><u>Domain Type Identification Value</u></td></tr><tr><td>Lowest</td><td>Logical Processor</td><td>1</td></tr><tr><td>Highest</td><td>Core</td><td>2</td></tr></table> <p>(Note that enumeration values of 0 and 3-255 are reserved.)</p> <p>Bits 31-16: Reserved.</p> | | <u>Hierarchy</u> | <u>Domain</u> | <u>Domain Type Identification Value</u> | Lowest | Logical Processor | 1 | Highest | Core | 2 |
| <u>Hierarchy</u> | <u>Domain</u> | <u>Domain Type Identification Value</u> | | | | | | | | | |
| Lowest | Logical Processor | 1 | | | | | | | | | |
| Highest | Core | 2 | | | | | | | | | |
| EDX | <p>Bits 31-00: x2APIC ID of the current logical processor.</p> <p>NOTES:</p> <p>* Software must not use the value of EBX[15:0] to enumerate processor topology of the system. The value is only intended for display and diagnostic purposes. The actual number of logical processors available to BIOS/OS/Applications may be different from the value of EBX[15:0], depending on software and platform hardware configurations.</p> | | | | | | | | | | |
| Processor Extended State Enumeration Main Leaf (Initial EAX Value = 0DH, ECX = 0) | | | | | | | | | | | |
| 0DH | <p>NOTES:</p> <p>Leaf 0DH main leaf (ECX = 0).</p> | | | | | | | | | | |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor | |
|---|--|--|
| | EAX | Bits 31-00: Reports the supported bits of the lower 32 bits of XCR0. XCR0[n] can be set to 1 only if EAX[n] is 1. Bit 00: x87 state. Bit 01: SSE state. Bit 02: AVX state. Bits 04-03: MPX state. Bits 07-05: AVX-512 state. Bit 08: Used for IA32_XSS. Bit 09: PKRU state. Bits 16-10: Used for IA32_XSS. Bit 17: TILECFG state. Bit 18: TILEDATA state. Bits 31-19: Reserved. |
| | EBX | Bits 31-00: Maximum size (bytes, from the beginning of the XSAVE/XRSTOR save area) required by enabled features in XCR0. May be different than ECX if some features at the end of the XSAVE save area are not enabled. |
| | ECX | Bit 31-00: Maximum size (bytes, from the beginning of the XSAVE/XRSTOR save area) of the XSAVE/XRSTOR save area required by all supported features in the processor, i.e., all the valid bit fields in XCR0. |
| | EDX | Bit 31-00: Reports the supported bits of the upper 32 bits of XCR0. XCR0[n+32] can be set to 1 only if EDX[n] is 1. Bits 31-00: Reserved. |
| <i>Processor Extended State Enumeration Sub-leaf (Initial EAX Value = 0DH, ECX = 1)</i> | | |
| 0DH | EAX | Bit 00: XSAVEOPT is available. Bit 01: Supports XSAVEC and the compacted form of XRSTOR if set. Bit 02: Supports XGETBV with ECX = 1 if set. Bit 03: Supports XSAVES/XRSTORS and IA32_XSS if set. Bit 04: Supports extended feature disable (XFD) if set. Bits 31-05: Reserved. |
| | EBX | Bits 31-00: The size in bytes of the XSAVE area containing all states enabled by XCR0 IA32_XSS. NOTES: If EAX[3] is enumerated as 0 and EAX[1] is enumerated as 1, EBX enumerates the size of the XSAVE area containing all states enabled by XCR0. If EAX[1] and EAX[3] are both enumerated as 0, EBX enumerates zero. |
| | ECX | Bits 31-00: Reports the supported bits of the lower 32 bits of the IA32_XSS MSR. IA32_XSS[n] can be set to 1 only if ECX[n] is 1. Bits 07-00: Used for XCR0. Bit 08: PT state. Bit 09: Used for XCR0. Bit 10: PASID state. Bit 11: CET user state. Bit 12: CET supervisor state. Bit 13: HDC state. Bit 14: UINTR state. Bit 15: LBR state (only for the architectural LBR feature). Bit 16: HWP state. Bits 18-17: Used for XCR0. Bits 31-19: Reserved. |
| | EDX | Bits 31-00: Reports the supported bits of the upper 32 bits of the IA32_XSS MSR. IA32_XSS[n+32] can be set to 1 only if EDX[n] is 1. Bits 31-00: Reserved. |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor |
|--|---|
| <i>Processor Extended State Enumeration Sub-leaves (Initial EAX Value = 0DH, ECX = n, n > 1)</i> | |
| 0DH | <p>NOTES:</p> <p>Leaf 0DH output depends on the initial value in ECX.</p> <p>Each sub-leaf index (starting at position 2) is supported if it corresponds to a supported bit in either the XCR0 register or the IA32_XSS MSR.</p> <p>* If ECX contains an invalid sub-leaf index, EAX/EBX/ECX/EDX return 0. Sub-leaf n ($0 \leq n \leq 31$) is invalid if sub-leaf 0 returns 0 in EAX[n] and sub-leaf 1 returns 0 in ECX[n]. Sub-leaf n ($32 \leq n \leq 63$) is invalid if sub-leaf 0 returns 0 in EDX[n-32] and sub-leaf 1 returns 0 in EDX[n-32].</p> <p>EAX Bits 31-00: The size in bytes (from the offset specified in EBX) of the save area for an extended state feature associated with a valid sub-leaf index, n.</p> <p>EBX Bits 31-00: The offset in bytes of this extended state component's save area from the beginning of the XSAVE/XRSTOR area. This field reports 0 if the sub-leaf index, n, does not map to a valid bit in the XCR0 register*.</p> <p>ECX Bit 00 is set if the bit n (corresponding to the sub-leaf index) is supported in the IA32_XSS MSR; it is clear if bit n is instead supported in XCR0. Bit 01 is set if, when the compacted format of an XSAVE area is used, this extended state component located on the next 64-byte boundary following the preceding state component (otherwise, it is located immediately following the preceding state component). Bits 31-02 are reserved. This field reports 0 if the sub-leaf index, n, is invalid*.</p> <p>EDX This field reports 0 if the sub-leaf index, n, is invalid*; otherwise it is reserved.</p> |
| <i>Intel® Resource Director Technology (Intel® RDT) Monitoring Enumeration Sub-leaf (Initial EAX Value = 0FH, ECX = 0)</i> | |
| 0FH | <p>NOTES:</p> <p>Leaf 0FH output depends on the initial value in ECX.</p> <p>Sub-leaf index 0 reports valid resource type starting at bit position 1 of EDX.</p> <p>EAX Reserved.</p> <p>EBX Bits 31-00: Maximum range (zero-based) of RMID within this physical processor of all types.</p> <p>ECX Reserved.</p> <p>EDX Bit 00: Reserved. Bit 01: Supports L3 Cache Intel RDT Monitoring if 1. Bits 31-02: Reserved.</p> |
| <i>L3 Cache Intel® RDT Monitoring Capability Enumeration Sub-leaf (Initial EAX Value = 0FH, ECX = 1)</i> | |
| 0FH | <p>NOTES:</p> <p>Leaf 0FH output depends on the initial value in ECX.</p> <p>EAX Bits 07-00: The counter width is encoded as an offset from 24b. A value of zero in this field indicates that 24-bit counters are supported. A value of 8 in this field indicates that 32-bit counters are supported. Bit 08: If 1, indicates the presence of an overflow bit in the IA32_QM_CTR MSR (bit 61). Bit 09: If 1, indicates the presence of non-CPU agent Intel RDT CMT support. Bit 10: If 1, indicates the presence of non-CPU agent Intel RDT MBM support. Bits 31-11: Reserved.</p> <p>EBX Bits 31-00: Conversion factor from reported IA32_QM_CTR value to occupancy metric (bytes) and Memory Bandwidth Monitoring (MBM) metrics.</p> <p>ECX Maximum range (zero-based) of RMID of this resource type.</p> |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor | |
|--|--|--|
| | EDX | Bit 00: Supports L3 occupancy monitoring if 1. Bit 01: Supports L3 Total Bandwidth monitoring if 1. Bit 02: Supports L3 Local Bandwidth monitoring if 1. Bits 31-03: Reserved. |
| <i>Intel® Resource Director Technology (Intel® RDT) Allocation Enumeration Sub-leaf (Initial EAX Value = 10H, ECX = 0)</i> | | |
| 10H | | NOTES: Leaf 10H output depends on the initial value in ECX. Sub-leaf index 0 reports valid resource identification (ResID) starting at bit position 1 of EBX. |
| | EAX | Reserved. |
| | EBX | Bit 00: Reserved. Bit 01: Supports L3 Cache Allocation Technology if 1. Bit 02: Supports L2 Cache Allocation Technology if 1. Bit 03: Supports Memory Bandwidth Allocation if 1. Bits 31-04: Reserved. |
| | ECX | Reserved. |
| | EDX | Reserved. |
| <i>L3 Cache Allocation Technology Enumeration Sub-leaf (Initial EAX Value = 10H, ECX = ResID = 1)</i> | | |
| 10H | | NOTES: Leaf 10H output depends on the initial value in ECX. |
| | EAX | Bits 04-00: Length of the capacity bit mask for the corresponding ResID. Add one to the return value to get the result. Bits 31-05: Reserved. |
| | EBX | Bits 31-00: Bit-granular map of isolation/contention of allocation units. |
| | ECX | Bit 00: Reserved. Bit 01: If 1, indicates L3 CAT for non-CPU agents is supported. Bit 02: If 1, indicates L3 Code and Data Prioritization Technology is supported. Bit 03: If 1, indicates non-contiguous capacity bitmask is supported. The bits that are set in the various IA32_L3_MASK_n registers do not have to be contiguous. Bits 31-04: Reserved. |
| | EDX | Bits 15-00: Highest Class of Service (CLOS) number supported for this ResID. Bits 31-16: Reserved. |
| <i>L2 Cache Allocation Technology Enumeration Sub-leaf (Initial EAX Value = 10H, ECX = ResID = 2)</i> | | |
| 10H | | NOTES: Leaf 10H output depends on the initial value in ECX. |
| | EAX | Bits 04-00: Length of the capacity bit mask for the corresponding ResID. Add one to the return value to get the result. Bits 31-05: Reserved. |
| | EBX | Bits 31-00: Bit-granular map of isolation/contention of allocation units. |
| | ECX | Bits 01-00: Reserved. Bit 02: CDP. If 1, indicates L2 Code and Data Prioritization Technology is supported. Bit 03: If 1, indicates non-contiguous capacity bitmask is supported. The bits that are set in the various IA32_L2_MASK_n registers do not have to be contiguous. Bits 31-04: Reserved. |
| | EDX | Bits 15-00: Highest CLOS number supported for this ResID. Bits 31-16: Reserved. |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor |
|---|---|
| <i>Memory Bandwidth Allocation Enumeration Sub-leaf (Initial EAX Value = 10H, ECX = ResID =3)</i> | |
| 10H | <p>NOTES: Leaf 10H output depends on the initial value in ECX.</p> <p>EAX Bits 11-00: Reports the maximum MBA throttling value supported for the corresponding ResID. Add one to the return value to get the result. Bits 31-12: Reserved.</p> <p>EBX Bits 31-00: Reserved.</p> <p>ECX Bits 01-00: Reserved. Bit 02: Reports whether the response of the delay values is linear. Bits 31-03: Reserved.</p> <p>EDX Bits 15-00: Highest CLOS number supported for this ResID. Bits 31-16: Reserved.</p> |
| <i>Intel® SGX Capability Enumeration Leaf, Sub-leaf 0 (Initial EAX Value = 12H, ECX = 0)</i> | |
| 12H | <p>NOTES: Leaf 12H sub-leaf 0 (ECX = 0) is supported if CPUID.(EAX=07H, ECX=0H):EBX[SGX] = 1.</p> <p>EAX Bit 00: SGX1. If 1, Indicates Intel SGX supports the collection of SGX1 leaf functions. Bit 01: SGX2. If 1, Indicates Intel SGX supports the collection of SGX2 leaf functions. Bits 06-02: Reserved. Bit 07: If 1, indicates Intel SGX supports ENCLU instruction leaf EVERIFYREPORT2. Bits 09-08: Reserved. Bit 10: If 1, indicates Intel SGX supports ENCLS instruction leaf EUPDATESVN. Bit 11: If 1, indicates Intel SGX supports ENCLU instruction leaf EDECCSSA. Bits 31-12: Reserved.</p> <p>EBX Bits 31-00: MISCSELECT. Bit vector of supported extended SGX features.</p> <p>ECX Bits 31-00: Reserved.</p> <p>EDX Bits 07-00: MaxEnclaveSize_Not64. The maximum supported enclave size in non-64-bit mode is $2^{(EDX[7:0])}$. Bits 15-08: MaxEnclaveSize_64. The maximum supported enclave size in 64-bit mode is $2^{(EDX[15:8])}$. Bits 31-16: Reserved.</p> |
| <i>Intel SGX Attributes Enumeration Leaf, Sub-leaf 1 (Initial EAX Value = 12H, ECX = 1)</i> | |
| 12H | <p>NOTES: Leaf 12H sub-leaf 1 (ECX = 1) is supported if CPUID.(EAX=07H, ECX=0H):EBX[SGX] = 1.</p> <p>EAX Bit 31-00: Reports the valid bits of SECS.ATTRIBUTES[31:0] that software can set with ECREATE.</p> <p>EBX Bit 31-00: Reports the valid bits of SECS.ATTRIBUTES[63:32] that software can set with ECREATE.</p> <p>ECX Bit 31-00: Reports the valid bits of SECS.ATTRIBUTES[95:64] that software can set with ECREATE.</p> <p>EDX Bit 31-00: Reports the valid bits of SECS.ATTRIBUTES[127:96] that software can set with ECREATE.</p> |
| <i>Intel® SGX EPC Enumeration Leaf, Sub-leaves (Initial EAX Value = 12H, ECX = 2 or higher)</i> | |
| 12H | <p>NOTES: Leaf 12H sub-leaf 2 or higher (ECX >= 2) is supported if CPUID.(EAX=07H, ECX=0H):EBX[SGX] = 1. For sub-leaves (ECX = 2 or higher), definition of EDX,ECX,EBX,EAX[31:4] depends on the sub-leaf type listed below.</p> |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor |
|--|---|
| | <p>EAX Bit 03-00: Sub-leaf Type 0000b: Indicates this sub-leaf is invalid. 0001b: This sub-leaf enumerates an EPC section. EBX:EAX and EDX:ECX provide information on the Enclave Page Cache (EPC) section. All other type encodings are reserved.</p> <p>Type 0000b. This sub-leaf is invalid. EDX:ECX:EBX:EAX return 0.</p> <p>Type 0001b. This sub-leaf enumerates an EPC sections with EDX:ECX, EBX:EAX defined as follows. EAX[11:04]: Reserved (enumerate 0). EAX[31:12]: Bits 31:12 of the physical address of the base of the EPC section. EBX[19:00]: Bits 51:32 of the physical address of the base of the EPC section. EBX[31:20]: Reserved. ECX[03:00]: EPC section property encoding defined as follows: If ECX[3:0] = 0000b, then all bits of the EDX:ECX pair are enumerated as 0. If ECX[3:0] = 0001b, then this section has confidentiality, integrity, and replay protection. If ECX[3:0] = 0010b, then this section has confidentiality protection only. If ECX[3:0] = 0011b, then this section has confidentiality and integrity protection. All other encodings are reserved. ECX[11:04]: Reserved (enumerate 0). ECX[31:12]: Bits 31:12 of the size of the corresponding EPC section within the Processor Reserved Memory. EDX[19:00]: Bits 51:32 of the size of the corresponding EPC section within the Processor Reserved Memory. EDX[31:20]: Reserved.</p> |
| <i>Intel® Processor Trace Enumeration Main Leaf (Initial EAX Value = 14H, ECX = 0)</i> | |
| 14H | <p>NOTES: Leaf 14H main leaf (ECX = 0).</p> <p>EAX Bits 31-00: Reports the maximum sub-leaf supported in leaf 14H.</p> <p>EBX Bit 00: If 1, indicates that IA32_RTIT_CTL.CR3Filter can be set to 1, and that IA32_RTIT_CR3_MATCH MSR can be accessed. Bit 01: If 1, indicates support of Configurable PSB and Cycle-Accurate Mode. Bit 02: If 1, indicates support of IP Filtering, TraceStop filtering, and preservation of Intel PT MSRs across warm reset. Bit 03: If 1, indicates support of MTC timing packet and suppression of COFI-based packets. Bit 04: If 1, indicates support of PTWRITE. Writes can set IA32_RTIT_CTL[12] (PTWEn) and IA32_RTIT_CTL[5] (FUPonPTW), and PTWRITE can generate packets. Bit 05: If 1, indicates support of Power Event Trace. Writes can set IA32_RTIT_CTL[4] (PwrEvtEn), enabling Power Event Trace packet generation. Bit 06: If 1, indicates support for PSB and PMI preservation. Writes can set IA32_RTIT_CTL[56] (InjectPsb-PmiOnEnable), enabling the processor to set IA32_RTIT_STATUS[7] (PendTopaPMI) and/or IA32_RTIT_STATUS[6] (PendPSB) in order to preserve ToPA PMIs and/or PSBs otherwise lost due to Intel PT disable. Writes can also set PendToPAPMI and PendPSB. Bit 07: If 1, writes can set IA32_RTIT_CTL[31] (EventEn), enabling Event Trace packet generation. Bit 08: If 1, writes can set IA32_RTIT_CTL[55] (DisTNT), disabling TNT packet generation. Bit 31-09: Reserved.</p> |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor | |
|---|--|--|
| | ECX | Bit 00: If 1, Tracing can be enabled with IA32_RTIT_CTL.ToPA = 1, hence utilizing the ToPA output scheme; IA32_RTIT_OUTPUT_BASE and IA32_RTIT_OUTPUT_MASK_PTRS MSRs can be accessed. Bit 01: If 1, ToPA tables can hold any number of output entries, up to the maximum allowed by the MaskOrTableOffset field of IA32_RTIT_OUTPUT_MASK_PTRS. Bit 02: If 1, indicates support of Single-Range Output scheme. Bit 03: If 1, indicates support of output to Trace Transport subsystem. Bit 30-04: Reserved. Bit 31: If 1, generated packets which contain IP payloads have LIP values, which include the CS base component. |
| | EDX | Bits 31-00: Reserved. |
| <i>Intel® Processor Trace Enumeration Sub-leaf (Initial EAX Value = 14H, ECX = 1)</i> | | |
| 14H | EAX | Bits 02-00: Number of configurable Address Ranges for filtering. Bits 15-03: Reserved. Bits 31-16: Bitmap of supported MTC period encodings. |
| | EBX | Bits 15-00: Bitmap of supported Cycle Threshold value encodings. Bit 31-16: Bitmap of supported Configurable PSB frequency encodings. |
| | ECX | Bits 31-00: Reserved. |
| | EDX | Bits 31-00: Reserved. |
| <i>Time Stamp Counter and Nominal Core Crystal Clock Information Leaf (Initial EAX Value = 15H)</i> | | |
| 15H | | NOTES: If EBX[31:0] is 0, the TSC/"core crystal clock" ratio is not enumerated. EBX[31:0]/EAX[31:0] indicates the ratio of the TSC frequency and the core crystal clock frequency. If ECX is 0, the nominal core crystal clock frequency is not enumerated. "TSC frequency" = "core crystal clock frequency" * EBX/EAX. The core crystal clock may differ from the reference clock, bus clock, or core clock frequencies. |
| | EAX | Bits 31-00: An unsigned integer which is the denominator of the TSC/"core crystal clock" ratio. |
| | EBX | Bits 31-00: An unsigned integer which is the numerator of the TSC/"core crystal clock" ratio. |
| | ECX | Bits 31-00: An unsigned integer which is the nominal frequency of the core crystal clock in Hz. |
| | EDX | Bits 31-00: Reserved = 0. |
| <i>Processor Frequency Information Leaf (Initial EAX Value = 16H)</i> | | |
| 16H | EAX | Bits 15-00: Processor Base Frequency (in MHz). Bits 31-16: Reserved = 0. |
| | EBX | Bits 15-00: Maximum Frequency (in MHz). Bits 31-16: Reserved = 0. |
| | ECX | Bits 15-00: Bus (Reference) Frequency (in MHz). Bits 31-16: Reserved = 0. |
| | EDX | Reserved. |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor | |
|--|---|---|
| | <p>NOTES:</p> <p>* Data is returned from this interface in accordance with the processor’s specification and does not reflect actual values. Suitable use of this data includes the display of processor information in like manner to the processor brand string and for determining the appropriate range to use when displaying processor information e.g. frequency history graphs. The returned information should not be used for any other purpose as the returned information does not accurately correlate to information / counters returned by other processor interfaces.</p> <p>While a processor may support the Processor Frequency Information leaf, fields that return a value of zero are not supported.</p> | |
| System-On-Chip Vendor Attribute Enumeration Main Leaf (Initial EAX Value = 17H, ECX = 0) | | |
| 17H | <p>NOTES:</p> <p>Leaf 17H main leaf (ECX = 0).</p> <p>Leaf 17H output depends on the initial value in ECX.</p> <p>Leaf 17H sub-leaves 1 through 3 reports SOC Vendor Brand String.</p> <p>Leaf 17H is valid if MaxSOCID_Index >= 3.</p> <p>Leaf 17H sub-leaves 4 and above are reserved.</p> | |
| EAX | Bits 31-00: MaxSOCID_Index. Reports the maximum input value of supported sub-leaf in leaf 17H. | |
| EBX | Bits 15-00: SOC Vendor ID. Bit 16: IsVendorScheme. If 1, the SOC Vendor ID field is assigned via an industry standard enumeration scheme. Otherwise, the SOC Vendor ID field is assigned by Intel. Bits 31-17: Reserved = 0. | |
| ECX | Bits 31-00: Project ID. A unique number an SOC vendor assigns to its SOC projects. | |
| EDX | Bits 31-00: Stepping ID. A unique number within an SOC project that an SOC vendor assigns. | |
| System-On-Chip Vendor Attribute Enumeration Sub-leaf (Initial EAX Value = 17H, ECX = 1..3) | | |
| 17H | EAX | Bit 31-00: SOC Vendor Brand String. UTF-8 encoded string. |
| | EBX | Bit 31-00: SOC Vendor Brand String. UTF-8 encoded string. |
| | ECX | Bit 31-00: SOC Vendor Brand String. UTF-8 encoded string. |
| | EDX | Bit 31-00: SOC Vendor Brand String. UTF-8 encoded string. |
| | <p>NOTES:</p> <p>Leaf 17H output depends on the initial value in ECX.</p> <p>SOC Vendor Brand String is a UTF-8 encoded string padded with trailing bytes of 00H.</p> <p>The complete SOC Vendor Brand String is constructed by concatenating in ascending order of EAX:EBX:ECX:EDX and from the sub-leaf 1 fragment towards sub-leaf 3.</p> | |
| System-On-Chip Vendor Attribute Enumeration Sub-leaves (Initial EAX Value = 17H, ECX > MaxSOCID_Index) | | |
| 17H | <p>NOTES:</p> <p>Leaf 17H output depends on the initial value in ECX.</p> | |
| | EAX | Bits 31-00: Reserved = 0. |
| | EBX | Bits 31-00: Reserved = 0. |
| | ECX | Bits 31-00: Reserved = 0. |
| | EDX | Bits 31-00: Reserved = 0. |

Bits 25-14: Maximum number of addressable IDs for logical processors sharing this translation cache** Bits 31-26: Reserved. |
| <i>Key Locker Leaf (Initial EAX Value = 19H)</i> | | |
| 19H | EAX | Bit 00: Key Locker restriction of CPL0-only supported. Bit 01: Key Locker restriction of no-encrypt supported. Bit 02: Key Locker restriction of no-decrypt supported. Bits 31-03: Reserved. |
| | EBX | Bit 00: AESKLE. If 1, the AES Key Locker instructions are fully enabled. Bit 01: Reserved. Bit 02: If 1, the AES wide Key Locker instructions are supported. Bit 03: Reserved. Bit 04: If 1, the platform supports the Key Locker MSRs (IA32_COPY_LOCAL_TO_PLATFORM, IA32_COPY_PLATFORM_TO_LOCAL, IA32_COPY_STATUS, and IA32_IWKEYBACKUP_STATUS) and backing up the internal wrapping key. Bits 31-05: Reserved. |
| | ECX | Bit 00: If 1, the NoBackup parameter to LOADIWKEY is supported. Bit 01: If 1, KeySource encoding of 1 (randomization of the internal wrapping key) is supported. Bits 31-02: Reserved. |
| | EDX | Reserved. |
| <i>Native Model ID Enumeration Leaf (Initial EAX Value = 1AH, ECX = 0)</i> | | |
| 1AH | NOTES: This leaf exists on all hybrid parts, however this leaf is not only available on hybrid parts. The following algorithm is used for detection of this leaf: If CPUID.0.MAXLEAF ≥ 1AH and CPUID.1A.EAX ≠ 0, then the leaf exists. | |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor | |
|--|--|--|
| | EAX | <p>Enumerates the native model ID and core type.</p> <p>Bits 31-24: Core type*</p> <p>10H: Reserved</p> <p>20H: Intel Atom®</p> <p>30H: Reserved</p> <p>40H: Intel® Core™</p> <p>Bits 23-00: Native model ID of the core. The core-type and native model ID can be used to uniquely identify the microarchitecture of the core. This native model ID is not unique across core types, and not related to the model ID reported in CPUID leaf 01H, and does not identify the SOC.</p> <p>* The core type may only be used as an identification of the microarchitecture for this logical processor and its numeric value has no significance, neither large nor small. This field neither implies nor expresses any other attribute to this logical processor and software should not assume any.</p> |
| | EBX | Reserved. |
| | ECX | Reserved. |
| | EDX | Reserved. |
| <i>PCONFIG Information Sub-leaf (Initial EAX Value = 1BH, ECX ≥ 0)</i> | | |
| 1BH | | <p>For details on this sub-leaf, see "INPUT EAX = 1BH: Returns PCONFIG Information" on page 3-240.</p> <p>NOTE:</p> <p>Leaf 1BH is supported if CPUID.(EAX=07H, ECX=0H):EDX[18] = 1.</p> |
| <i>Last Branch Records Information Leaf (Initial EAX Value = 1CH)</i> | | |
| 1CH | | <p>NOTE:</p> <p>This leaf pertains to the architectural feature.</p> |
| | EAX | <p>Bits 07-00: Supported LBR Depth Values. For each bit n set in this field, the IA32_LBR_DEPTH.DEPTH value 8*(n+1) is supported.</p> <p>Bits 29-08: Reserved.</p> <p>Bit 30: Deep C-state Reset. If set, indicates that LBRs may be cleared on an MWAIT that requests a C-state numerically greater than C1.</p> <p>Bit 31: IP Values Contain LIP. If set, LBR IP values contain LIP. If clear, IP values contain Effective IP.</p> |
| | EBX | <p>Bit 00: CPL Filtering Supported. If set, the processor supports setting IA32_LBR_CTL[2:1] to non-zero value.</p> <p>Bit 01: Branch Filtering Supported. If set, the processor supports setting IA32_LBR_CTL[22:16] to non-zero value.</p> <p>Bit 02: Call-stack Mode Supported. If set, the processor supports setting IA32_LBR_CTL[3] to 1.</p> <p>Bits 31-03: Reserved.</p> |
| | ECX | <p>Bit 00: Mispredict Bit Supported. IA32_LBR_x_INFO[63] holds indication of branch misprediction (MISPRED).</p> <p>Bit 01: Timed LBRs Supported. IA32_LBR_x_INFO[15:0] holds CPU cycles since last LBR entry (CYC_CNT), and IA32_LBR_x_INFO[60] holds an indication of whether the value held there is valid (CYC_CNT_VALID).</p> <p>Bit 02: Branch Type Field Supported. IA32_LBR_INFO_x[59:56] holds indication of the recorded operation's branch type (BR_TYPE).</p> <p>Bits 15-03: Reserved.</p> <p>Bits 19-16: Event Logging Supported bitmap.</p> <p>Bits 31-20: Reserved.</p> |
| | EDX | Bits 31-00: Reserved. |
| <i>Tile Information Main Leaf (Initial EAX Value = 1DH, ECX = 0)</i> | | |
| 1DH | | <p>NOTES:</p> <p>For sub-leaves of 1DH, they are indexed by the palette id.</p> <p>Leaf 1DH sub-leaves 2 and above are reserved.</p> |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor | |
|---|--|---|
| | EAX | Bits 31-00: max_palette. Highest numbered palette sub-leaf. Value = 1. |
| | EBX | Bits 31-00: Reserved = 0. |
| | ECX | Bits 31-00: Reserved = 0. |
| | EDX | Bits 31-00: Reserved = 0. |
| <i>Tile Palette 1 Sub-leaf (Initial EAX Value = 1DH, ECX = 1)</i> | | |
| 1DH | EAX | Bits 15-00: Palette 1 total_tile_bytes. Value = 8192. Bits 31-16: Palette 1 bytes_per_tile. Value = 1024. |
| | EBX | Bits 15-00: Palette 1 bytes_per_row. Value = 64. Bits 31-16: Palette 1 max_names (number of tile registers). Value = 8. |
| | ECX | Bits 15-00: Palette 1 max_rows. Value = 16. Bits 31-16: Reserved = 0. |
| | EDX | Bits 31-00: Reserved = 0. |
| <i>TMUL Information Main Leaf (Initial EAX Value = 1EH, ECX = 0)</i> | | |
| 1EH | NOTE: Leaf 1EH sub-leaves 1 and above are reserved. | |
| | EAX | Bits 31-00: Reserved = 0. |
| | EBX | Bits 07-00: tmul_maxk (rows or columns). Value = 16. Bits 23-08: tmul_maxn (column bytes). Value = 64. Bits 31-24: Reserved = 0. |
| | ECX | Bits 31-00: Reserved = 0. |
| | EDX | Bits 31-00: Reserved = 0. |
| <i>V2 Extended Topology Enumeration Leaf (Initial EAX Value = 1FH, ECX ≥ 0)</i> | | |
| 1FH | NOTES: <p><i>CPUID leaf 1FH is a preferred superset to leaf 0BH. Intel recommends using leaf 1FH when available rather than leaf 0BH and ensuring that any leaf 0BH algorithms are updated to support leaf 1FH.</i></p> <p>The sub-leaves of CPUID leaf 1FH describe an ordered hierarchy of logical processors starting from the smallest-scoped domain of a Logical Processor (sub-leaf index 0) to the Core domain (sub-leaf index 1) to the largest-scoped domain (the last valid sub-leaf index) that is implicitly subordinate to the unenumerated highest-scoped domain of the processor package (socket).</p> <p>The details of each valid domain is enumerated by a corresponding sub-leaf. Details for a domain include its type and how all instances of that domain determine the number of logical processors and x2 APIC ID partitioning at the next higher-scoped domain. The ordering of domains within the hierarchy is fixed architecturally as shown below. For a given processor, not all domains may be relevant or enumerated; however, the logical processor and core domains are always enumerated. As an example, a processor may report an ordered hierarchy consisting only of "Logical Processor," "Core," and "Die."</p> <p>For two valid sub-leaves N and N+1, sub-leaf N+1 represents the next immediate higher-scoped domain with respect to the domain of sub-leaf N for the given processor.</p> <p>If sub-leaf index "N" returns an invalid domain type in ECX[15:08] (00H), then all sub-leaves with an index greater than "N" shall also return an invalid domain type. A sub-leaf returning an invalid domain always returns 0 in EAX and EBX.</p> | |
| | EAX | Bits 04-00: The number of bits that the x2APIC ID must be shifted to the right to address instances of the next higher-scoped domain. When logical processor is not supported by the processor, the value of this field at the Logical Processor domain sub-leaf may be returned as either 0 (no allocated bits in the x2APIC ID) or 1 (one allocated bit in the x2APIC ID); software should plan accordingly. Bits 31-05: Reserved. |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--|---|--|---|------------------|---------------|---|--------|-------------------|---|-----|------|---|-----|--------|---|-----|------|---|-----|-----|---|-----|--------|---|---------|----------------|-----------|
| | EBX | Bits 15-00: The number of logical processors across all instances of this domain within the next higher-scoped domain relative to this current logical processor. (For example, in a processor socket/package comprising “M” dies of “N” cores each, where each core has “L” logical processors, the “die” domain sub-leaf value of this field would be M*N*L. In an asymmetric topology this would be the summation of the value across the lower domain level instances to create each upper domain level instance.) This number reflects configuration as shipped by Intel. Note, software must not use this field to enumerate processor topology*. Bits 31-16: Reserved. | | | | | | | | | | | | | | | | | | | | | | | | | |
| | ECX | Bits 07-00: The input ECX sub-leaf index. Bits 15-08: Domain Type. This field provides an identification value which indicates the domain as shown below. Although domains are ordered, as also shown below, their assigned identification values are not and software should not depend on it. (For example, if a new domain between core and module is specified, it will have an identification value higher than 5.) <table><tr><td><u>Hierarchy</u></td><td><u>Domain</u></td><td><u>Domain Type Identification Value</u></td></tr><tr><td>Lowest</td><td>Logical Processor</td><td>1</td></tr><tr><td>...</td><td>Core</td><td>2</td></tr><tr><td>...</td><td>Module</td><td>3</td></tr><tr><td>...</td><td>Tile</td><td>4</td></tr><tr><td>...</td><td>Die</td><td>5</td></tr><tr><td>...</td><td>DieGrp</td><td>6</td></tr><tr><td>Highest</td><td>Package/Socket</td><td>(implied)</td></tr></table> (Note that enumeration values of 0 and 7-255 are reserved.) | | <u>Hierarchy</u> | <u>Domain</u> | <u>Domain Type Identification Value</u> | Lowest | Logical Processor | 1 | ... | Core | 2 | ... | Module | 3 | ... | Tile | 4 | ... | Die | 5 | ... | DieGrp | 6 | Highest | Package/Socket | (implied) |
| | <u>Hierarchy</u> | <u>Domain</u> | <u>Domain Type Identification Value</u> | | | | | | | | | | | | | | | | | | | | | | | | |
| | Lowest | Logical Processor | 1 | | | | | | | | | | | | | | | | | | | | | | | | |
| | ... | Core | 2 | | | | | | | | | | | | | | | | | | | | | | | | |
| | ... | Module | 3 | | | | | | | | | | | | | | | | | | | | | | | | |
| | ... | Tile | 4 | | | | | | | | | | | | | | | | | | | | | | | | |
| | ... | Die | 5 | | | | | | | | | | | | | | | | | | | | | | | | |
| | ... | DieGrp | 6 | | | | | | | | | | | | | | | | | | | | | | | | |
| | Highest | Package/Socket | (implied) | | | | | | | | | | | | | | | | | | | | | | | | |
| EDX | Bits 31-16: Reserved. Bits 31-00: x2APIC ID of the current logical processor. It is always valid and does not vary with the sub-leaf index in ECX. | | | | | | | | | | | | | | | | | | | | | | | | | | |
| NOTES: * Software must not use the value of EBX[15:0] to enumerate processor topology of the system. The value is only intended for display and diagnostic purposes. The actual number of logical processors available to BIOS/OS/Applications may be different from the value of EBX[15:0], depending on software and platform hardware configurations. | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Processor History Reset Sub-leaf (Initial EAX Value = 20H, ECX = 0) | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 20H | EAX | Reports the maximum number of sub-leaves that are supported in leaf 20H. | | | | | | | | | | | | | | | | | | | | | | | | | |
| | EBX | Indicates which bits may be set in the IA32_HRESET_ENABLE MSR to enable reset of different components of hardware-maintained history. Bit 00: Indicates support for both HRESET’s EAX[0] parameter, and IA32_HRESET_ENABLE[0] set by the OS to enable reset of Intel® Thread Director history. Bits 31-01: Reserved = 0. | | | | | | | | | | | | | | | | | | | | | | | | | |
| | ECX | Reserved. | | | | | | | | | | | | | | | | | | | | | | | | | |
| | EDX | Reserved. | | | | | | | | | | | | | | | | | | | | | | | | | |
| Architectural Performance Monitoring Extended Main Leaf (Initial EAX Value = 23H, ECX = 0) | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 23H | NOTE: Output depends on ECX input value. | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | EAX | Bits 31-0: If bit <i>n</i> is set, sub-leaf <i>n</i> is supported. (For unsupported sub-leaves, 0 is returned in the registers EAX, EBX, ECX, and EDX.) | | | | | | | | | | | | | | | | | | | | | | | | | |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor | |
|---|---|---|
| | EBX | Bit 00: UnitMask2 supported. If set, the processor supports the UnitMask2 field in the IA32_PERFVTSELx MSRs. Bit 01: EQ-bit supported. If set, the processor supports the equal flag in the IA32_PERFVTSELx MSRs. Bits 31-02: Reserved. |
| | ECX | Bits 07-00: Number of Top-down Microarchitecture Analysis (TMA) slots per cycle. This number can be multiplied by the number of cycles (from CPU_CLK_UNHALTED.THREAD / CPU_CLK_UNHALTED.CORE or IA32_FIXED_CTR1) to determine the total number of slots. Bits 31-08: Reserved. |
| | EDX | Bits 31-00: Reserved. |
| Architectural Performance Monitoring Extended Sub-Leaf (Initial EAX Value = 23H, ECX = 1) | | |
| 23H | EAX | Bits 31-00: General counters bitmap. For each bit <i>n</i> set in this field, the processor supports general-purpose performance monitoring counter <i>n</i> . |
| | EBX | Bits 31-00: Fixed counters bitmap. For each bit <i>m</i> set in this field, the processor supports fixed-function performance monitoring counter <i>m</i> . ¹ |
| | ECX | Bits 31-00: Reserved. |
| | EDX | Bits 31-00: Reserved. |
| Architectural Performance Monitoring Extended Sub-Leaf (Initial EAX Value = 23H, ECX = 2) | | |
| 23H | EAX | Bits 31-00: Bitmap of Auto Counter Reload (ACR) general counters that can be reloaded. For each bit <i>n</i> set in this field, the processor supports ACR for general-purpose performance monitoring counter <i>n</i> . |
| | EBX | Bits 31-00: Bitmap of Auto Counter Reload (ACR) fixed counters that can be reloaded. For each bit <i>m</i> set in this field, the processor supports ACR for fixed-function performance monitoring counter <i>m</i> . |
| | ECX | Bits 31-00: Bitmap of Auto Counter Reload (ACR) general counters that can cause reloads. For each bit <i>y</i> set in this field, the processor allows general-purpose performance monitoring counter <i>y</i> to reload all existing general-purpose performance monitoring counters capable of being reloaded. |
| | EDX | Bits 31-00: Bitmap of Auto Counter Reload (ACR) fixed counters that can cause reloads. For each bit <i>x</i> set in this field, the processor allows fixed-function performance monitoring counter <i>x</i> to reload all existing fixed-function performance monitoring counters capable of being reloaded. |
| Architectural Performance Monitoring Extended Sub-Leaf (Initial EAX Value = 23H, ECX = 3) | | |
| 23H | <p>NOTE: Architectural Performance Monitoring Events Bitmap. For each bit <i>n</i> set in this field, the processor supports Architectural Performance Monitoring Event of index <i>n</i>.</p> | |
| | EAX | Bit 00: Core cycles. Bit 01: Instructions retired. Bit 02: Reference cycles. Bit 03: Last level cache references. Bit 04: Last level cache misses. Bit 05: Branch instructions retired. Bit 06: Branch mispredicts retired. Bit 07: Topdown slots. Bit 08: Topdown backend bound. Bit 09: Topdown bad speculation. |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor | |
|---|--|--|
| | | Bit 10: Topdown frontend bound. Bit 11: Topdown retiring. Bit 12: LBR inserts. Bits 31-13: Reserved. EBX Bits 31-00: Reserved. ECX Bits 31-00: Reserved. EDX Bits 31-00: Reserved. |
| Converged Vector ISA Main Leaf (Initial EAX Value = 24H, ECX = 0) | | |
| 24H | | NOTE: Output depends on ECX input value. EAX Bits 31-00: Reports the maximum number sub-leaves that are supported in leaf 24H. EBX Bits 07-00: Reports the Intel AVX10 Converged Vector ISA version. Bits 15-08: Reserved. Bit 18-16: Reserved at 111. ² Bits 31-19: Reserved. ECX Bits 31-00: Reserved. EDX Bits 31-00: Reserved. |
| Unimplemented CPUID Leaf Functions | | |
| 21H | | Invalid. No existing or future CPU will return processor identification or feature information if the initial EAX value is 21H. If the value returned by CPUID.0:EAX (the maximum input value for basic CPUID information) is at least 21H, 0 is returned in the registers EAX, EBX, ECX, and EDX. Otherwise, the data for the highest basic information leaf is returned. |
| 40000000H — 4FFFFFFFH | | Invalid. No existing or future CPU will return processor identification or feature information if the initial EAX value is in the range 40000000H to 4FFFFFFFH. |
| Extended Function CPUID Information | | |
| 80000000H | EAX EBX ECX EDX | Maximum Input Value for Extended Function CPUID Information. Reserved. Reserved. Reserved. |
| 80000001H | EAX EBX ECX | Extended Processor Signature and Feature Bits. Reserved. Bit 00: LAHF/SAHF available in 64-bit mode.* Bits 04-01: Reserved. Bit 05: LZCNT. Bits 07-06: Reserved. Bit 08: PREFETCHW. Bits 31-09: Reserved. |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor | |
|-------------------|--|--|
| | EDX | Bits 10-00: Reserved. Bit 11: SYSCALL/SYSRET.** Bits 19-12: Reserved = 0. Bit 20: Execute Disable Bit available. Bits 25-21: Reserved = 0. Bit 26: 1-GByte pages are available if 1. Bit 27: RDTSCP and IA32_TSC_AUX are available if 1. Bit 28: Reserved = 0. Bit 29: Intel® 64 Architecture available if 1. Bits 31-30: Reserved = 0. NOTES: * LAHF and SAHF are always available in other modes, regardless of the enumeration of this feature flag. ** Intel processors support SYSCALL and SYSRET only in 64-bit mode. This feature flag is always enumerated as 0 outside 64-bit mode. |

| 80000006H | EAX EBX ECX EDX | Reserved = 0. Reserved = 0. Bits 07-00: Cache Line size in bytes. Bits 11-08: Reserved. Bits 15-12: L2 Associativity field *. Bits 31-16: Cache size in 1K units. Reserved = 0. NOTES: * L2 associativity field encodings: 00H - Disabled 01H - 1 way (direct mapped) 02H - 2 ways 03H - Reserved 04H - 4 ways 05H - Reserved 06H - 8 ways 07H - See CPUID leaf 04H, sub-leaf 2** 08H - 16 ways 09H - Reserved 0AH - 32 ways 0BH - 48 ways 0CH - 64 ways 0DH - 96 ways 0EH - 128 ways 0FH - Fully associative ** CPUID leaf 04H provides details of deterministic cache parameters, including the L2 cache in sub-leaf 2 |

Table 3-17. Information Returned by CPUID Instruction (Contd.)

| Initial EAX Value | Information Provided about the Processor | |
|-------------------|--|---|
| 80000007H | EAX EBX ECX EDX | Reserved = 0. Reserved = 0. Reserved = 0. Bits 07-00: Reserved = 0. Bit 08: Invariant TSC available if 1. Bits 31-09: Reserved = 0. |
| 80000008H | EAX EBX ECX EDX | Linear/Physical Address size. Bits 07-00: #Physical Address Bits*. Bits 15-08: #Linear Address Bits. Bits 23-16: #Guest Physical Address Bits. This value applies only to software operating in a virtual machine (Intel processors enumerate this value as zero). When this field is zero, refer to #Physical Address Bits for the number of guest physical address bits. Bits 31-24: Reserved = 0. Bits 08-00: Reserved = 0. Bit 09: WBNOINVD is available if 1. Bits 31-10: Reserved = 0. Reserved = 0. Reserved = 0. NOTES: * If CPUID.80000008H:EAX[7:0] is supported, the maximum physical address number supported should come from this field. If TME-MK is enabled, the number of bits that can be used to address physical memory is CPUID.80000008H:EAX[7:0] - IA32_TME_ACTIVATE[35:32]. |

NOTES:

1. The valid range of fixed-function counters is 0 through 15.
2. Earlier versions of this specification documented these bits as enumerating support for different vector lengths. Processors enumerating Intel® AVX10 support all vector widths.

INPUT EAX = 0: Returns CPUID's Highest Value for Basic Processor Information and the Vendor Identification String

When CPUID executes with EAX set to 0, the processor returns the highest value the CPUID recognizes for returning basic processor information. The value is returned in the EAX register and is processor specific.

A vendor identification string is also returned in EBX, EDX, and ECX. For Intel processors, the string is "GenuineIntel" and is expressed:

EBX := 756e6547h (* "Genu", with G in the low eight bits of BL *)
EDX := 49656e69h (* "inel", with i in the low eight bits of DL *)
ECX := 6c65746eh (* "ntel", with n in the low eight bits of CL *)

INPUT EAX = 80000000H: Returns CPUID's Highest Value for Extended Processor Information

When CPUID executes with EAX set to 80000000H, the processor returns the highest value the processor recognizes for returning extended processor information. The value is returned in the EAX register and is processor specific.

IA32_BIOS_SIGN_ID Returns Microcode Update Signature

For processors that support the microcode update facility, the IA32_BIOS_SIGN_ID MSR is loaded with the update signature whenever CPUID executes. The signature is returned in the upper DWORD. For details, see Chapter 11 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A.

INPUT EAX = 01H: Returns Model, Family, Stepping Information

When CPUID executes with EAX set to 01H, version information is returned in EAX (see Figure 3-6). For example: model, family, and processor type for the Intel Xeon processor 5100 series is as follows:

- Model — 1111B
- Family — 0101B
- Processor Type — 00B

See Table 3-18 for available processor type values. Stepping IDs are provided as needed.

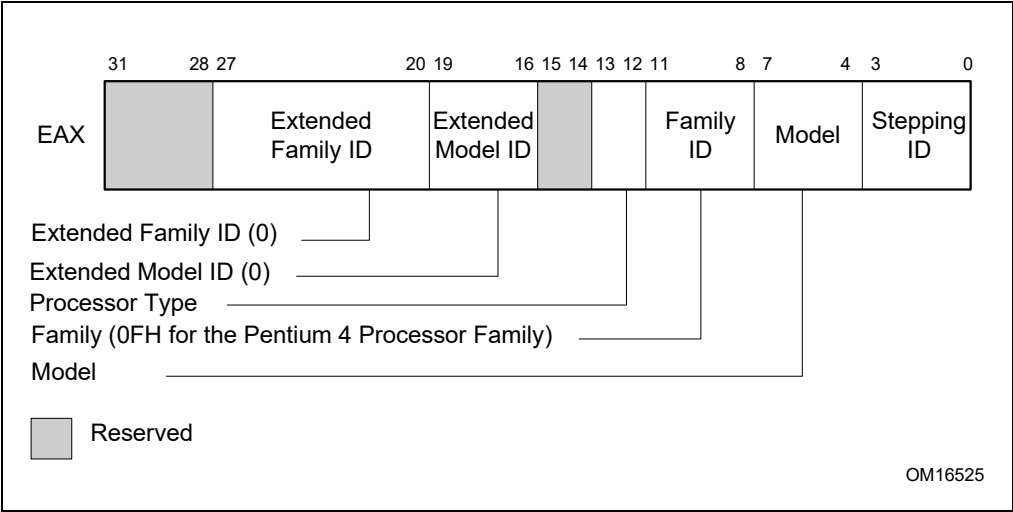

Figure 3-6. Version Information Returned by CPUID in EAX

Table 3-18. Processor Type Field

| Type | Encoding |
|--|----------|
| Original OEM Processor | 00B |
| Intel OverDrive [®] Processor | 01B |
| Dual processor (not applicable to Intel486 processors) | 10B |
| Intel reserved | 11B |

NOTE

See Chapter 21 in the Intel[®] 64 and IA-32 Architectures Software Developer’s Manual, Volume 1, for information on identifying earlier IA-32 processors.

The Extended Family ID needs to be examined only when the Family ID is 0FH. Integrate the fields into a display using the following rule:

```
IF Family_ID ≠ 0FH
  THEN DisplayFamily = Family_ID;
  ELSE DisplayFamily = Extended_Family_ID + Family_ID;
FI;
(* Show DisplayFamily as HEX field. *)
```

The Extended Model ID needs to be examined only when the Family ID is 06H or 0FH. Integrate the field into a display using the following rule:

```
IF (Family_ID = 06H or Family_ID = 0FH)
  THEN DisplayModel = (Extended_Model_ID << 4) + Model_ID;
  (* Right justify and zero-extend 4-bit field; display Model_ID as HEX field.*)
  ELSE DisplayModel = Model_ID;
FI;
(* Show DisplayModel as HEX field. *)
```

INPUT EAX = 01H: Returns Additional Information in EBX

When CPUID executes with EAX set to 01H, additional information is returned to the EBX register:

- Brand index (low byte of EBX) — this number provides an entry into a brand string table that contains brand strings for IA-32 processors. More information about this field is provided later in this section.
- CLFLUSH instruction cache line size (second byte of EBX) — this number indicates the size of the cache line flushed by the CLFLUSH and CLFLUSHOPT instructions in 8-byte increments. This field was introduced in the Pentium 4 processor.
- Local APIC ID (high byte of EBX) — this number is the 8-bit ID that is assigned to the local APIC on the processor during power up. This field was introduced in the Pentium 4 processor.

INPUT EAX = 01H: Returns Feature Information in ECX and EDX

When CPUID executes with EAX set to 01H, feature information is returned in ECX and EDX.

- Figure 3-7 and Table 3-19 show encodings for ECX.
- Figure 3-8 and Table 3-20 show encodings for EDX.

For all feature flags, a 1 indicates that the feature is supported. Use Intel to properly interpret feature flags.

NOTE

Software must confirm that a processor feature is present using feature flags returned by CPUID prior to using the feature. Software should not depend on future offerings retaining all features.

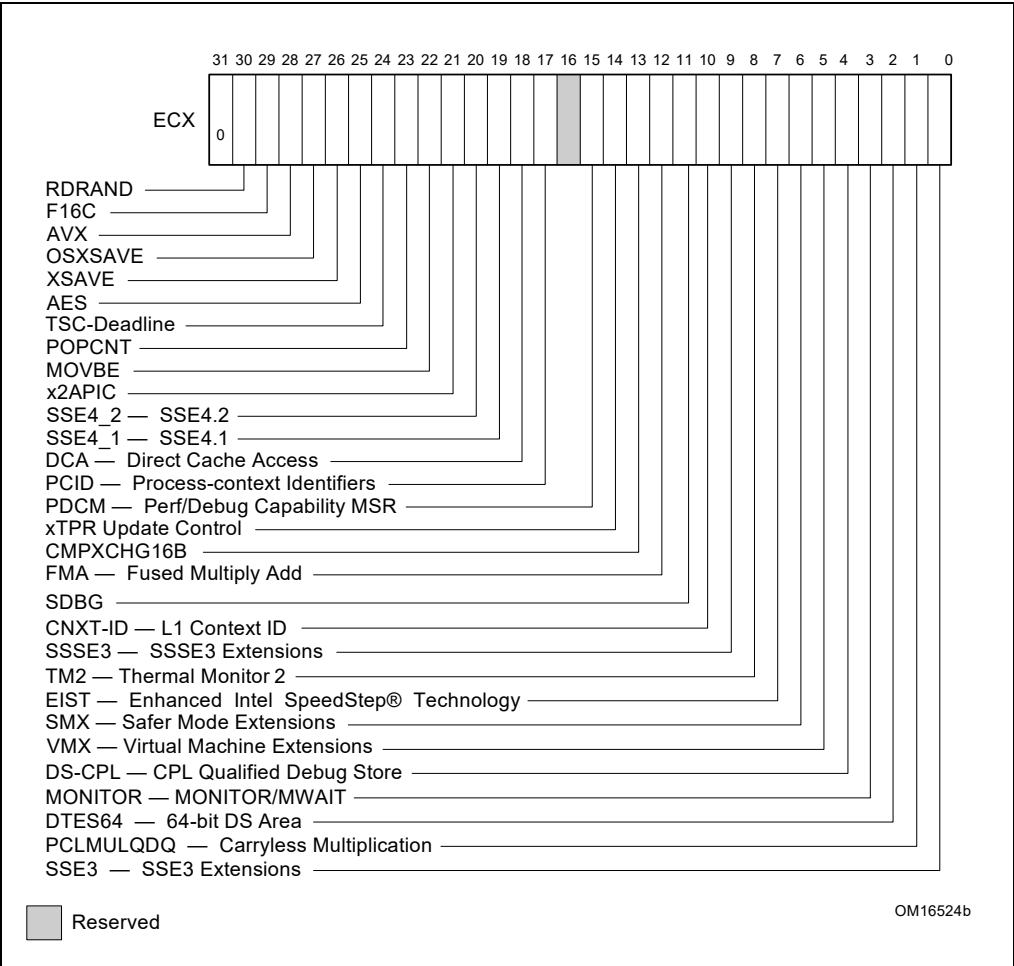

Figure 3-7. Feature Information Returned in the ECX Register

Table 3-19. Feature Information Returned in the ECX Register

| Bit # | Mnemonic | Description |
|-------|---------------------|--|
| 0 | SSE3 | Streaming SIMD Extensions 3 (SSE3). A value of 1 indicates the processor supports this technology. |
| 1 | PCLMULQDQ | PCLMULQDQ. A value of 1 indicates the processor supports the PCLMULQDQ instruction. |
| 2 | DTES64 | 64-bit DS Area. A value of 1 indicates the processor supports DS area using 64-bit layout. |
| 3 | MONITOR | MONITOR/MWAIT. A value of 1 indicates the processor supports this feature. |
| 4 | DS-CPL | CPL Qualified Debug Store. A value of 1 indicates the processor supports the extensions to the Debug Store feature to allow for branch message storage qualified by CPL. |
| 5 | VMX | Virtual Machine Extensions. A value of 1 indicates that the processor supports this technology. |
| 6 | SMX | Safer Mode Extensions. A value of 1 indicates that the processor supports this technology. See Chapter 7, “Safer Mode Extensions Reference.” |
| 7 | EIST | Enhanced Intel SpeedStep® technology. A value of 1 indicates that the processor supports this technology. |
| 8 | TM2 | Thermal Monitor 2. A value of 1 indicates whether the processor supports this technology. |
| 9 | SSSE3 | A value of 1 indicates the presence of the Supplemental Streaming SIMD Extensions 3 (SSSE3). A value of 0 indicates the instruction extensions are not present in the processor. |
| 10 | CNXT-ID | L1 Context ID. A value of 1 indicates the L1 data cache mode can be set to either adaptive mode or shared mode. A value of 0 indicates this feature is not supported. See definition of the IA32_MISC_ENABLE MSR Bit 24 (L1 Data Cache Context Mode) for details. |
| 11 | SDBG | A value of 1 indicates the processor supports IA32_DEBUG_INTERFACE MSR for silicon debug. |
| 12 | FMA | A value of 1 indicates the processor supports FMA extensions using YMM state. |
| 13 | CMPXCHG16B | CMPXCHG16B Available. A value of 1 indicates that the feature is available. See the “CMPXCHG8B/CMPXCHG16B—Compare and Exchange Bytes” section in this chapter for a description. |
| 14 | xTPR Update Control | xTPR Update Control. A value of 1 indicates that the processor supports changing IA32_MISC_ENABLE[bit 23]. |
| 15 | PDCM | PerfMon and Debug Capability: A value of 1 indicates the processor supports the performance and debug feature indication MSR IA32_PERF_CAPABILITIES. |
| 16 | Reserved | Reserved |
| 17 | PCID | Process-context identifiers. A value of 1 indicates that the processor supports PCIDs and that software may set CR4.PCIDE to 1. |
| 18 | DCA | A value of 1 indicates the processor supports the ability to prefetch data from a memory mapped device. |
| 19 | SSE4_1 | A value of 1 indicates that the processor supports SSE4.1. |
| 20 | SSE4_2 | A value of 1 indicates that the processor supports SSE4.2. |
| 21 | x2APIC | A value of 1 indicates that the processor supports x2APIC feature. |
| 22 | MOVBE | A value of 1 indicates that the processor supports MOVBE instruction. |
| 23 | POPCNT | A value of 1 indicates that the processor supports the POPCNT instruction. |
| 24 | TSC-Deadline | A value of 1 indicates that the processor’s local APIC timer supports one-shot operation using a TSC deadline value. |
| 25 | AESNI | A value of 1 indicates that the processor supports the AESNI instruction extensions. |
| 26 | XSAVE | A value of 1 indicates that the processor supports the XSAVE/XRSTOR processor extended states feature, the XSETBV/XGETBV instructions, and XCRO. |
| 27 | OSXSAVE | A value of 1 indicates that the OS has set CR4.OSXSAVE[bit 18] to enable XSETBV/XGETBV instructions to access XCRO and to support processor extended state management using XSAVE/XRSTOR. |
| 28 | AVX | A value of 1 indicates the processor supports the AVX instruction extensions. |

Table 3-19. Feature Information Returned in the ECX Register (Contd.)

| Bit # | Mnemonic | Description |
|-------|----------|---|
| 29 | F16C | A value of 1 indicates that processor supports 16-bit floating-point conversion instructions. |
| 30 | RDRAND | A value of 1 indicates that processor supports RDRAND instruction. |
| 31 | Not Used | Always returns 0. |

Figure 3-8. Feature Information Returned in the EDX Register

Table 3-20. More on Feature Information Returned in the EDX Register

| Bit # | Mnemonic | Description |
|-------|----------|--|
| 0 | FPU | Floating-Point Unit On-Chip. The processor contains an x87 FPU. |
| 1 | VME | Virtual 8086 Mode Enhancements. Virtual 8086 mode enhancements, including CR4.VME for controlling the feature, CR4.PVI for protected mode virtual interrupts, software interrupt indirection, expansion of the TSS with the software indirection bitmap, and EFLAGS.VIF and EFLAGS.VIP flags. |
| 2 | DE | Debugging Extensions. Support for I/O breakpoints, including CR4.DE for controlling the feature, and optional trapping of accesses to DR4 and DR5. |
| 3 | PSE | Page Size Extension. Large pages of size 4 MByte are supported, including CR4.PSE for controlling the feature, the defined dirty bit in PDE (Page Directory Entries), optional reserved bit trapping in CR3, PDEs, and PTEs. |
| 4 | TSC | Time Stamp Counter. The RDTSC instruction is supported, including CR4.TSD for controlling privilege. |
| 5 | MSR | Model Specific Registers RDMSR and WRMSR Instructions. The RDMSR and WRMSR instructions are supported. Some of the MSRs are implementation dependent. |
| 6 | PAE | Physical Address Extension. Physical addresses greater than 32 bits are supported: extended page table entry formats, an extra level in the page translation tables is defined, 2-MByte pages are supported instead of 4 Mbyte pages if PAE bit is 1. |
| 7 | MCE | Machine Check Exception. Exception 18 is defined for Machine Checks, including CR4.MCE for controlling the feature. This feature does not define the model-specific implementations of machine-check error logging, reporting, and processor shutdowns. Machine Check exception handlers may have to depend on processor version to do model specific processing of the exception, or test for the presence of the Machine Check feature. |
| 8 | CX8 | CMPXCHG8B Instruction. The compare-and-exchange 8 bytes (64 bits) instruction is supported (implicitly locked and atomic). |
| 9 | APIC | APIC On-Chip. The processor contains an Advanced Programmable Interrupt Controller (APIC), responding to memory mapped commands in the physical address range FFFE0000H to FFFE0FFFH (by default - some processors permit the APIC to be relocated). |
| 10 | Reserved | Reserved |
| 11 | SEP | SYSENTER and SYSEXIT Instructions. The SYSENTER and SYSEXIT and associated MSRs are supported. |
| 12 | MTRR | Memory Type Range Registers. MTRRs are supported. The MTRRcap MSR contains feature bits that describe what memory types are supported, how many variable MTRRs are supported, and whether fixed MTRRs are supported. |
| 13 | PGE | Page Global Bit. The global bit is supported in paging-structure entries that map a page, indicating TLB entries that are common to different processes and need not be flushed. The CR4.PGE bit controls this feature. |
| 14 | MCA | Machine Check Architecture. A value of 1 indicates the Machine Check Architecture of reporting machine errors is supported. The MCG_CAP MSR contains feature bits describing how many banks of error reporting MSRs are supported. |
| 15 | CMOV | Conditional Move Instructions. The conditional move instruction CMOV is supported. In addition, if x87 FPU is present as indicated by the CPUID.FPU feature bit, then the FCOMI and FCMOV instructions are supported |
| 16 | PAT | Page Attribute Table. Page Attribute Table is supported. This feature augments the Memory Type Range Registers (MTRRs), allowing an operating system to specify attributes of memory accessed through a linear address on a 4KB granularity. |
| 17 | PSE-36 | 36-Bit Page Size Extension. 4-MByte pages addressing physical memory beyond 4 GBytes are supported with 32-bit paging. This feature indicates that upper bits of the physical address of a 4-MByte page are encoded in bits 20:13 of the page-directory entry. Such physical addresses are limited by MAXPHYADDR and may be up to 40 bits in size. |
| 18 | PSN | Processor Serial Number. The processor supports the 96-bit processor identification number feature and the feature is enabled. |
| 19 | CLFSH | CLFLUSH Instruction. CLFLUSH Instruction is supported. |
| 20 | Reserved | Reserved |

Table 3-20. More on Feature Information Returned in the EDX Register (Contd.)

| Bit # | Mnemonic | Description |
|-------|----------|---|
| 21 | DS | Debug Store. The processor supports the ability to write debug information into a memory resident buffer. This feature is used by the branch trace store (BTS) and processor event-based sampling (PEBS) facilities (see Chapter 25, "Introduction to Virtual Machine Extensions," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C). |
| 22 | ACPI | Thermal Monitor and Software Controlled Clock Facilities. The processor implements internal MSRs that allow processor temperature to be monitored and processor performance to be modulated in predefined duty cycles under software control. |
| 23 | MMX | Intel MMX Technology. The processor supports the Intel MMX technology. |
| 24 | FXSR | FXSAVE and FXRSTOR Instructions. The FXSAVE and FXRSTOR instructions are supported for fast save and restore of the floating-point context. Presence of this bit also indicates that CR4.OSFXSR is available for an operating system to indicate that it supports the FXSAVE and FXRSTOR instructions. |
| 25 | SSE | SSE. The processor supports the SSE extensions. |
| 26 | SSE2 | SSE2. The processor supports the SSE2 extensions. |
| 27 | SS | Self Snoop. The processor supports the management of conflicting memory types by performing a snoop of its own cache structure for transactions issued to the bus. |
| 28 | HTT | Max APIC IDs reserved field is Valid. A value of 0 for HTT indicates there is only a single logical processor in the package and software should assume only a single APIC ID is reserved. A value of 1 for HTT indicates the value in CPUID.1.EBX[23:16] (the Maximum number of addressable IDs for logical processors in this package) is valid for the package. |
| 29 | TM | Thermal Monitor. The processor implements the thermal monitor automatic thermal control circuitry (TCC). |
| 30 | Reserved | Reserved |
| 31 | PBE | Pending Break Enable. The processor supports the use of the FERR#/PBE# pin when the processor is in the stop-clock state (STPCLK# is asserted) to signal the processor that an interrupt is pending and that the processor should return to normal operation to handle the interrupt. |

INPUT EAX = 02H: TLB/Cache/Prefetch Information Returned in EAX, EBX, ECX, EDX

When CPUID executes with EAX set to 02H, the processor returns information about the processor's internal TLBs, cache, and prefetch hardware in the EAX, EBX, ECX, and EDX registers. The information is reported in encoded form and fall into the following categories:

- The least-significant byte in register EAX (register AL) will always return 01H. Software should ignore this value and not interpret it as an informational descriptor.
- The most significant bit (bit 31) of each register indicates whether the register contains valid information (set to 0) or is reserved (set to 1).
- If a register contains valid information, the information is contained in 1 byte descriptors. There are four types of encoding values for the byte descriptor, the encoding type is noted in the second column of Table 3-21. Table 3-21 lists the encoding of these descriptors. Note that the order of descriptors in the EAX, EBX, ECX, and EDX registers is not defined; that is, specific bytes are not designated to contain descriptors for specific cache, prefetch, or TLB types. The descriptors may appear in any order. Note also a processor may report a general descriptor type (FFH) and not report any byte descriptor of "cache type" via CPUID leaf 2.

Table 3-21. Encoding of CPUID Leaf 2 Descriptors

| Descriptor Value | Type | Cache or TLB Description |
|------------------|---------|---|
| 00H | General | Null descriptor, this byte contains no information. |
| 01H | TLB | Instruction TLB: 4 KByte pages, 4-way set associative, 32 entries. |
| 02H | TLB | Instruction TLB: 4 MByte pages, fully associative, 2 entries. |
| 03H | TLB | Data TLB: 4 KByte pages, 4-way set associative, 64 entries. |
| 04H | TLB | Data TLB: 4 MByte pages, 4-way set associative, 8 entries. |
| 05H | TLB | Data TLB1: 4 MByte pages, 4-way set associative, 32 entries. |
| 06H | Cache | 1st-level instruction cache: 8 KBytes, 4-way set associative, 32 byte line size. |
| 08H | Cache | 1st-level instruction cache: 16 KBytes, 4-way set associative, 32 byte line size. |
| 09H | Cache | 1st-level instruction cache: 32KBytes, 4-way set associative, 64 byte line size. |
| 0AH | Cache | 1st-level data cache: 8 KBytes, 2-way set associative, 32 byte line size. |
| 0BH | TLB | Instruction TLB: 4 MByte pages, 4-way set associative, 4 entries. |
| 0CH | Cache | 1st-level data cache: 16 KBytes, 4-way set associative, 32 byte line size. |
| 0DH | Cache | 1st-level data cache: 16 KBytes, 4-way set associative, 64 byte line size. |
| 0EH | Cache | 1st-level data cache: 24 KBytes, 6-way set associative, 64 byte line size. |
| 1DH | Cache | 2nd-level cache: 128 KBytes, 2-way set associative, 64 byte line size. |
| 21H | Cache | 2nd-level cache: 256 KBytes, 8-way set associative, 64 byte line size. |
| 22H | Cache | 3rd-level cache: 512 KBytes, 4-way set associative, 64 byte line size, 2 lines per sector. |
| 23H | Cache | 3rd-level cache: 1 MBytes, 8-way set associative, 64 byte line size, 2 lines per sector. |
| 24H | Cache | 2nd-level cache: 1 MBytes, 16-way set associative, 64 byte line size. |
| 25H | Cache | 3rd-level cache: 2 MBytes, 8-way set associative, 64 byte line size, 2 lines per sector. |
| 29H | Cache | 3rd-level cache: 4 MBytes, 8-way set associative, 64 byte line size, 2 lines per sector. |
| 2CH | Cache | 1st-level data cache: 32 KBytes, 8-way set associative, 64 byte line size. |
| 30H | Cache | 1st-level instruction cache: 32 KBytes, 8-way set associative, 64 byte line size. |
| 40H | Cache | No 2nd-level cache or, if processor contains a valid 2nd-level cache, no 3rd-level cache. |
| 41H | Cache | 2nd-level cache: 128 KBytes, 4-way set associative, 32 byte line size. |
| 42H | Cache | 2nd-level cache: 256 KBytes, 4-way set associative, 32 byte line size. |
| 43H | Cache | 2nd-level cache: 512 KBytes, 4-way set associative, 32 byte line size. |
| 44H | Cache | 2nd-level cache: 1 MByte, 4-way set associative, 32 byte line size. |
| 45H | Cache | 2nd-level cache: 2 MByte, 4-way set associative, 32 byte line size. |
| 46H | Cache | 3rd-level cache: 4 MByte, 4-way set associative, 64 byte line size. |
| 47H | Cache | 3rd-level cache: 8 MByte, 8-way set associative, 64 byte line size. |
| 48H | Cache | 2nd-level cache: 3MByte, 12-way set associative, 64 byte line size. |
| 49H | Cache | 3rd-level cache: 4MB, 16-way set associative, 64-byte line size (Intel Xeon processor MP, Family 0FH, Model 06H); 2nd-level cache: 4 MByte, 16-way set associative, 64 byte line size. |
| 4AH | Cache | 3rd-level cache: 6MByte, 12-way set associative, 64 byte line size. |
| 4BH | Cache | 3rd-level cache: 8MByte, 16-way set associative, 64 byte line size. |
| 4CH | Cache | 3rd-level cache: 12MByte, 12-way set associative, 64 byte line size. |
| 4DH | Cache | 3rd-level cache: 16MByte, 16-way set associative, 64 byte line size. |
| 4EH | Cache | 2nd-level cache: 6MByte, 24-way set associative, 64 byte line size. |
| 4FH | TLB | Instruction TLB: 4 KByte pages, 32 entries. |

Table 3-21. Encoding of CPUID Leaf 2 Descriptors (Contd.)

| Descriptor Value | Type | Cache or TLB Description |
|------------------|-------|--|
| 50H | TLB | Instruction TLB: 4 KByte and 2-MByte or 4-MByte pages, 64 entries. |
| 51H | TLB | Instruction TLB: 4 KByte and 2-MByte or 4-MByte pages, 128 entries. |
| 52H | TLB | Instruction TLB: 4 KByte and 2-MByte or 4-MByte pages, 256 entries. |
| 55H | TLB | Instruction TLB: 2-MByte or 4-MByte pages, fully associative, 7 entries. |
| 56H | TLB | Data TLB0: 4 MByte pages, 4-way set associative, 16 entries. |
| 57H | TLB | Data TLB0: 4 KByte pages, 4-way associative, 16 entries. |
| 59H | TLB | Data TLB0: 4 KByte pages, fully associative, 16 entries. |
| 5AH | TLB | Data TLB0: 2 MByte or 4 MByte pages, 4-way set associative, 32 entries. |
| 5BH | TLB | Data TLB: 4 KByte and 4 MByte pages, 64 entries. |
| 5CH | TLB | Data TLB: 4 KByte and 4 MByte pages, 128 entries. |
| 5DH | TLB | Data TLB: 4 KByte and 4 MByte pages, 256 entries. |
| 60H | Cache | 1st-level data cache: 16 KByte, 8-way set associative, 64 byte line size. |
| 61H | TLB | Instruction TLB: 4 KByte pages, fully associative, 48 entries. |
| 63H | TLB | Data TLB: 2 MByte or 4 MByte pages, 4-way set associative, 32 entries and a separate array with 1 GByte pages, 4-way set associative, 4 entries. |
| 64H | TLB | Data TLB: 4 KByte pages, 4-way set associative, 512 entries. |
| 66H | Cache | 1st-level data cache: 8 KByte, 4-way set associative, 64 byte line size. |
| 67H | Cache | 1st-level data cache: 16 KByte, 4-way set associative, 64 byte line size. |
| 68H | Cache | 1st-level data cache: 32 KByte, 4-way set associative, 64 byte line size. |
| 6AH | Cache | uTLB: 4 KByte pages, 8-way set associative, 64 entries. |
| 6BH | Cache | DTLB: 4 KByte pages, 8-way set associative, 256 entries. |
| 6CH | Cache | DTLB: 2M/4M pages, 8-way set associative, 128 entries. |
| 6DH | Cache | DTLB: 1 GByte pages, fully associative, 16 entries. |
| 70H | Cache | Trace cache: 12 K- μ op, 8-way set associative. |
| 71H | Cache | Trace cache: 16 K- μ op, 8-way set associative. |
| 72H | Cache | Trace cache: 32 K- μ op, 8-way set associative. |
| 76H | TLB | Instruction TLB: 2M/4M pages, fully associative, 8 entries. |
| 78H | Cache | 2nd-level cache: 1 MByte, 4-way set associative, 64byte line size. |
| 79H | Cache | 2nd-level cache: 128 KByte, 8-way set associative, 64 byte line size, 2 lines per sector. |
| 7AH | Cache | 2nd-level cache: 256 KByte, 8-way set associative, 64 byte line size, 2 lines per sector. |
| 7BH | Cache | 2nd-level cache: 512 KByte, 8-way set associative, 64 byte line size, 2 lines per sector. |
| 7CH | Cache | 2nd-level cache: 1 MByte, 8-way set associative, 64 byte line size, 2 lines per sector. |
| 7DH | Cache | 2nd-level cache: 2 MByte, 8-way set associative, 64byte line size. |
| 7FH | Cache | 2nd-level cache: 512 KByte, 2-way set associative, 64-byte line size. |
| 80H | Cache | 2nd-level cache: 512 KByte, 8-way set associative, 64-byte line size. |
| 82H | Cache | 2nd-level cache: 256 KByte, 8-way set associative, 32 byte line size. |
| 83H | Cache | 2nd-level cache: 512 KByte, 8-way set associative, 32 byte line size. |
| 84H | Cache | 2nd-level cache: 1 MByte, 8-way set associative, 32 byte line size. |
| 85H | Cache | 2nd-level cache: 2 MByte, 8-way set associative, 32 byte line size. |
| 86H | Cache | 2nd-level cache: 512 KByte, 4-way set associative, 64 byte line size. |
| 87H | Cache | 2nd-level cache: 1 MByte, 8-way set associative, 64 byte line size. |

Table 3-21. Encoding of CPUID Leaf 2 Descriptors (Contd.)

| Descriptor Value | Type | Cache or TLB Description |
|------------------|----------|--|
| A0H | DTLB | DTLB: 4k pages, fully associative, 32 entries. |
| B0H | TLB | Instruction TLB: 4 KByte pages, 4-way set associative, 128 entries. |
| B1H | TLB | Instruction TLB: 2M pages, 4-way, 8 entries or 4M pages, 4-way, 4 entries. |
| B2H | TLB | Instruction TLB: 4KByte pages, 4-way set associative, 64 entries. |
| B3H | TLB | Data TLB: 4 KByte pages, 4-way set associative, 128 entries. |
| B4H | TLB | Data TLB1: 4 KByte pages, 4-way associative, 256 entries. |
| B5H | TLB | Instruction TLB: 4KByte pages, 8-way set associative, 64 entries. |
| B6H | TLB | Instruction TLB: 4KByte pages, 8-way set associative, 128 entries. |
| BAH | TLB | Data TLB1: 4 KByte pages, 4-way associative, 64 entries. |
| C0H | TLB | Data TLB: 4 KByte and 4 MByte pages, 4-way associative, 8 entries. |
| C1H | STLB | Shared 2nd-Level TLB: 4 KByte/2MByte pages, 8-way associative, 1024 entries. |
| C2H | DTLB | DTLB: 4 KByte/2 MByte pages, 4-way associative, 16 entries. |
| C3H | STLB | Shared 2nd-Level TLB: 4 KByte /2 MByte pages, 6-way associative, 1536 entries. Also 1GByte pages, 4-way, 16 entries. |
| C4H | DTLB | DTLB: 2M/4M Byte pages, 4-way associative, 32 entries. |
| CAH | STLB | Shared 2nd-Level TLB: 4 KByte pages, 4-way associative, 512 entries. |
| D0H | Cache | 3rd-level cache: 512 KByte, 4-way set associative, 64 byte line size. |
| D1H | Cache | 3rd-level cache: 1 MByte, 4-way set associative, 64 byte line size. |
| D2H | Cache | 3rd-level cache: 2 MByte, 4-way set associative, 64 byte line size. |
| D6H | Cache | 3rd-level cache: 1 MByte, 8-way set associative, 64 byte line size. |
| D7H | Cache | 3rd-level cache: 2 MByte, 8-way set associative, 64 byte line size. |
| D8H | Cache | 3rd-level cache: 4 MByte, 8-way set associative, 64 byte line size. |
| DCH | Cache | 3rd-level cache: 1.5 MByte, 12-way set associative, 64 byte line size. |
| DDH | Cache | 3rd-level cache: 3 MByte, 12-way set associative, 64 byte line size. |
| DEH | Cache | 3rd-level cache: 6 MByte, 12-way set associative, 64 byte line size. |
| E2H | Cache | 3rd-level cache: 2 MByte, 16-way set associative, 64 byte line size. |
| E3H | Cache | 3rd-level cache: 4 MByte, 16-way set associative, 64 byte line size. |
| E4H | Cache | 3rd-level cache: 8 MByte, 16-way set associative, 64 byte line size. |
| EAH | Cache | 3rd-level cache: 12MByte, 24-way set associative, 64 byte line size. |
| EBH | Cache | 3rd-level cache: 18MByte, 24-way set associative, 64 byte line size. |
| ECH | Cache | 3rd-level cache: 24MByte, 24-way set associative, 64 byte line size. |
| FOH | Prefetch | 64-Byte prefetching. |
| F1H | Prefetch | 128-Byte prefetching. |
| FEH | General | CPUID leaf 2 does not report TLB descriptor information; use CPUID leaf 18H to query TLB and other address translation parameters. |
| FFH | General | CPUID leaf 2 does not report cache descriptor information, use CPUID leaf 4 to query cache parameters. |

Example 3-1. Example of Cache and TLB Interpretation

The first member of the family of Pentium 4 processors returns the following information about caches and TLBs when the CPUID executes with an input value of 2:

```
EAX    66 5B 50 01H
EBX     0H
ECX     0H
EDX    00 7A 70 00H
```

Which means:

- The least-significant byte (byte 0) of register EAX is set to 01H. This value should be ignored.
- The most-significant bit of all four registers (EAX, EBX, ECX, and EDX) is set to 0, indicating that each register contains valid 1-byte descriptors.
- Bytes 1, 2, and 3 of register EAX indicate that the processor has:
 - 50H - a 64-entry instruction TLB, for mapping 4-KByte and 2-MByte or 4-MByte pages.
 - 5BH - a 64-entry data TLB, for mapping 4-KByte and 4-MByte pages.
 - 66H - an 8-KByte 1st level data cache, 4-way set associative, with a 64-Byte cache line size.
- The descriptors in registers EBX and ECX are valid, but contain NULL descriptors.
- Bytes 0, 1, 2, and 3 of register EDX indicate that the processor has:
 - 00H - NULL descriptor.
 - 70H - Trace cache: 12 K-μop, 8-way set associative.
 - 7AH - a 256-KByte 2nd level cache, 8-way set associative, with a sectored, 64-byte cache line size.
 - 00H - NULL descriptor.

INPUT EAX = 04H: Returns Deterministic Cache Parameters for Each Level

When CPUID executes with EAX set to 04H and ECX contains an index value, the processor returns encoded data that describe a set of deterministic cache parameters (for the cache level associated with the input in ECX). Valid index values start from 0.

Software can enumerate the deterministic cache parameters for each level of the cache hierarchy starting with an index value of 0, until the parameters report the value associated with the cache type field is 0. The architecturally defined fields reported by deterministic cache parameters are documented in Table 3-17.

This Cache Size in Bytes

$$\begin{aligned} &= (\text{Ways} + 1) * (\text{Partitions} + 1) * (\text{Line_Size} + 1) * (\text{Sets} + 1) \\ &= (\text{EBX}[31:22] + 1) * (\text{EBX}[21:12] + 1) * (\text{EBX}[11:0] + 1) * (\text{ECX} + 1) \end{aligned}$$

The CPUID leaf 04H also reports data that can be used to derive the topology of processor cores in a physical package. This information is constant for all valid index values. Software can query the raw data reported by executing CPUID with EAX=04H and ECX=0 and use it as part of the topology enumeration algorithm described in Chapter 10, “Multiple-Processor Management,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A.

INPUT EAX = 05H: Returns MONITOR and MWAIT Features

When CPUID executes with EAX set to 05H, the processor returns information about features available to MONITOR/MWAIT instructions. The MONITOR instruction is used for address-range monitoring in conjunction with MWAIT instruction. The MWAIT instruction optionally provides additional extensions for advanced power management. See Table 3-17.

INPUT EAX = 06H: Returns Thermal and Power Management Features

When CPUID executes with EAX set to 06H, the processor returns information about thermal and power management features. See Table 3-17.

INPUT EAX = 07H: Returns Structured Extended Feature Enumeration Information

When CPUID executes with EAX set to 07H and ECX = 0, the processor returns information about the maximum input value for sub-leaves that contain extended feature flags. See Table 3-17.

When CPUID executes with EAX set to 07H and the input value of ECX is invalid (see leaf 07H entry in Table 3-17), the processor returns 0 in EAX/EBX/ECX/EDX. In subleaf 0, EAX returns the maximum input value of the highest leaf 7 sub-leaf, and EBX, ECX & EDX contain information of extended feature flags.

INPUT EAX = 09H: Returns Direct Cache Access Information

When CPUID executes with EAX set to 09H, the processor returns information about Direct Cache Access capabilities. See Table 3-17.

INPUT EAX = 0AH: Returns Architectural Performance Monitoring Features

When CPUID executes with EAX set to 0AH, the processor returns information about support for architectural performance monitoring capabilities. Architectural performance monitoring is supported if the version ID (see Table 3-17) is greater than Pn 0. See Table 3-17.

For each version of architectural performance monitoring capability, software must enumerate this leaf to discover the programming facilities and the architectural performance events available in the processor. The details are described in Chapter 25, “Introduction to Virtual Machine Extensions,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3C.

INPUT EAX = 0BH: Returns Extended Topology Information

CPUID leaf 1FH is a preferred superset to leaf 0BH. Intel recommends first checking for the existence of Leaf 1FH before using leaf 0BH.

When CPUID executes with EAX set to 0BH, the processor returns information about extended topology enumeration data. Software must detect the presence of CPUID leaf 0BH by verifying (a) the highest leaf index supported by CPUID is $\geq 0BH$, and (b) CPUID.0BH:EBX[15:0] reports a non-zero value. See Table 3-17.

INPUT EAX = 0DH: Returns Processor Extended States Enumeration Information

When CPUID executes with EAX set to 0DH and ECX = 0, the processor returns information about the bit-vector representation of all processor state extensions that are supported in the processor and storage size requirements of the XSAVE/XRSTOR area. See Table 3-17.

When CPUID executes with EAX set to 0DH and ECX = n ($n > 1$, and is a valid sub-leaf index), the processor returns information about the size and offset of each processor extended state save area within the XSAVE/XRSTOR area. See Table 3-17. Software can use the forward-extendable technique depicted below to query the valid sub-leaves and obtain size and offset information for each processor extended state save area:

For i = 2 to 62 // sub-leaf 1 is reserved

IF (CPUID.(EAX=0DH, ECX=0H):VECTOR[i] = 1) // VECTOR is the 64-bit value of EDX:EAX

Execute CPUID.(EAX=0DH, ECX = i) to examine size and offset for sub-leaf i;

FI;

INPUT EAX = 0FH: Returns Intel Resource Director Technology (Intel RDT) Monitoring Enumeration Information

When CPUID executes with EAX set to 0FH and ECX = 0, the processor returns information about the bit-vector representation of QoS monitoring resource types that are supported in the processor and maximum range of RMID values the processor can use to monitor of any supported resource types. Each bit, starting from bit 1, corresponds to a specific resource type if the bit is set. The bit position corresponds to the sub-leaf index (or ResID) that software must use to query QoS monitoring capability available for that type. See Table 3-17.

When CPUID executes with EAX set to 0FH and ECX = n ($n \geq 1$, and is a valid ResID), the processor returns information software can use to program IA32_PQR_ASSOC, IA32_QM_EVTSEL MSRs before reading QoS data from the IA32_QM_CTR MSR.

INPUT EAX = 10H: Returns Intel Resource Director Technology (Intel RDT) Allocation Enumeration Information

When CPUID executes with EAX set to 10H and ECX = 0, the processor returns information about the bit-vector representation of QoS Enforcement resource types that are supported in the processor. Each bit, starting from bit 1, corresponds to a specific resource type if the bit is set. The bit position corresponds to the sub-leaf index (or ResID) that software must use to query QoS enforcement capability available for that type. See Table 3-17.

When CPUID executes with EAX set to 10H and ECX = n (n ≥ 1, and is a valid ResID), the processor returns information about available classes of service and range of QoS mask MSRs that software can use to configure each class of services using capability bit masks in the QoS Mask registers, IA32_resourceType_Mask_n.

INPUT EAX = 12H: Returns Intel SGX Enumeration Information

When CPUID executes with EAX set to 12H and ECX = 0H, the processor returns information about Intel SGX capabilities. See Table 3-17.

When CPUID executes with EAX set to 12H and ECX = 1H, the processor returns information about Intel SGX attributes. See Table 3-17.

When CPUID executes with EAX set to 12H and ECX = n (n > 1), the processor returns information about Intel SGX Enclave Page Cache. See Table 3-17.

INPUT EAX = 14H: Returns Intel Processor Trace Enumeration Information

When CPUID executes with EAX set to 14H and ECX = 0H, the processor returns information about Intel Processor Trace extensions. See Table 3-17.

When CPUID executes with EAX set to 14H and ECX = n (n > 0 and less than the number of non-zero bits in CPUID.(EAX=14H, ECX= 0H).EAX), the processor returns information about packet generation in Intel Processor Trace. See Table 3-17.

INPUT EAX = 15H: Returns Time Stamp Counter and Nominal Core Crystal Clock Information

When CPUID executes with EAX set to 15H and ECX = 0H, the processor returns information about Time Stamp Counter and Core Crystal Clock. See Table 3-17.

INPUT EAX = 16H: Returns Processor Frequency Information

When CPUID executes with EAX set to 16H, the processor returns information about Processor Frequency Information. See Table 3-17.

INPUT EAX = 17H: Returns System-On-Chip Information

When CPUID executes with EAX set to 17H, the processor returns information about the System-On-Chip Vendor Attribute Enumeration. See Table 3-17.

INPUT EAX = 18H: Returns Deterministic Address Translation Parameters Information

When CPUID executes with EAX set to 18H, the processor returns information about the Deterministic Address Translation Parameters. See Table 3-17.

INPUT EAX = 19H: Returns Key Locker Information

When CPUID executes with EAX set to 19H, the processor returns information about Key Locker. See Table 3-17.

INPUT EAX = 1AH: Returns Native Model ID Information

When CPUID executes with EAX set to 1AH, the processor returns information about Native Model Identification. See Table 3-17.

INPUT EAX = 1BH: Returns PCONFIG Information

When CPUID executes with EAX set to 1BH, the processor returns information about PCONFIG capabilities. This information is enumerated in sub-leaves selected by the value of ECX (starting with 0).

Each sub-leaf of CPUID function 1BH enumerates its **sub-leaf type** in EAX. If a sub-leaf type is 0, the sub-leaf is invalid and zero is returned in EBX, ECX, and EDX. In this case, all subsequent sub-leaves (selected by larger input values of ECX) are also invalid.

The only valid sub-leaf type currently defined is 1, indicating that the sub-leaf enumerates target identifiers for the PCONFIG instruction. Any non-zero value returned in EBX, ECX, or EDX indicates a valid target identifier of the PCONFIG instruction (any value of zero should be ignored). The only target identifier currently defined is 1, indicating TME-MK. See the “PCONFIG—Platform Configuration” instruction in Chapter 4 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2B, for more information.

INPUT EAX = 1CH: Returns Last Branch Record Information

When CPUID executes with EAX set to 1CH, the processor returns information about LBRs (the architectural feature). See Table 3-17.

INPUT EAX = 1DH: Returns Tile Information

When CPUID executes with EAX set to 1DH and ECX = 0H, the processor returns information about tile architecture. See Table 3-17.

When CPUID executes with EAX set to 1DH and ECX = 1H, the processor returns information about tile palette 1. See Table 3-17.

INPUT EAX = 1EH: Returns TMUL Information

When CPUID executes with EAX set to 1EH and ECX = 0H, the processor returns information about TMUL capabilities. See Table 3-17.

INPUT EAX = 1FH: Returns V2 Extended Topology Information

When CPUID executes with EAX set to 1FH, the processor returns information about extended topology enumeration data. Software must detect the presence of CPUID leaf 1FH by verifying (a) the highest leaf index supported by CPUID is $\geq 1FH$, and (b) CPUID.1FH:EBX[15:0] reports a non-zero value. See Table 3-17.

INPUT EAX = 20H: Returns History Reset Information

When CPUID executes with EAX set to 20H, the processor returns information about History Reset. See Table 3-17.

INPUT EAX = 23H: Returns Architectural Performance Monitoring Extended Information

When CPUID executes with EAX set to 23H, the processor returns architectural performance monitoring extended information. See Table 3-17.

INPUT EAX = 24H: Returns Intel AVX10 Converged Vector ISA Information

When CPUID executes with EAX set to 24H, the processor returns Intel AVX10 converged vector ISA information. See Table 3-17.

METHODS FOR RETURNING BRANDING INFORMATION

Use the following techniques to access branding information:

1. Processor brand string method.
2. Processor brand index; this method uses a software supplied brand string table.

These two methods are discussed in the following sections. For methods that are available in early processors, see Section: “Identification of Earlier IA-32 Processors” in Chapter 21 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1.

The Processor Brand String Method

Figure 3-9 describes the algorithm used for detection of the brand string. Processor brand identification software should execute this algorithm on all Intel 64 and IA-32 processors.

This method (introduced with Pentium 4 processors) returns an ASCII brand identification string and the Processor Base frequency of the processor to the EAX, EBX, ECX, and EDX registers.

Figure 3-9. Determination of Support for the Processor Brand String

How Brand Strings Work

To use the brand string method, execute CPUID with EAX input of 8000002H through 80000004H. For each input value, CPUID returns 16 ASCII characters using EAX, EBX, ECX, and EDX. The returned string will be NULL-terminated.

Table 3-22 shows the brand string that is returned by the first processor in the Pentium 4 processor family.

Table 3-22. Processor Brand String Returned with Pentium 4 Processor

| EAX Input Value | Return Values | ASCII Equivalent |
|-----------------|--|--------------------------------------|
| 80000002H | EAX = 20202020H EBX = 20202020H ECX = 20202020H EDX = 6E492020H | " " " " " " " " " "nl " |
| 80000003H | EAX = 286C6574H EBX = 50202952H ECX = 69746E65H EDX = 52286D75H | "(let" "P)R" "itne" "R(mu" |

Table 3-22. Processor Brand String Returned with Pentium 4 Processor (Contd.)

| EAX Input Value | Return Values | ASCII Equivalent |
|-----------------|--|---------------------------------------|
| 80000004H | EAX = 20342029H EBX = 20555043H ECX = 30303531H EDX = 007A484DH | " 4)" " UPC" "0051" "\0zHM" |

Extracting the Processor Frequency from Brand Strings

Figure 3-10 provides an algorithm which software can use to extract the Processor Base frequency from the processor brand string.

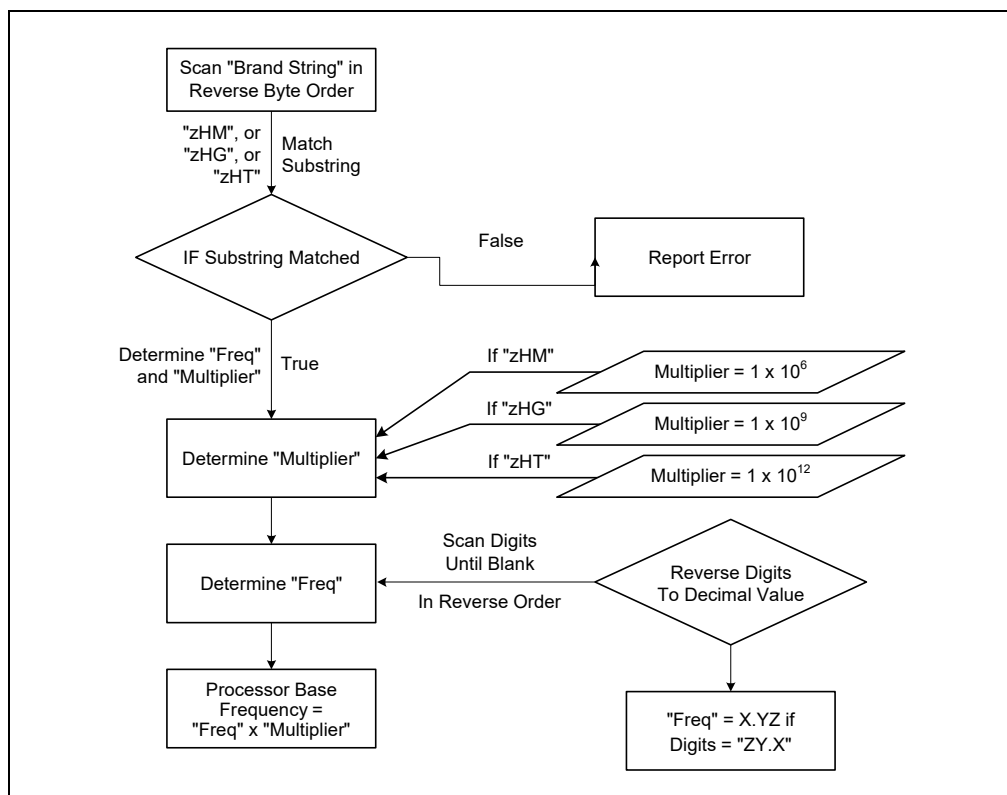

Figure 3-10. Algorithm for Extracting Processor Frequency

The Processor Brand Index Method

The brand index method (introduced with Pentium® III Xeon® processors) provides an entry point into a brand identification table that is maintained in memory by system software and is accessible from system- and user-level code. In this table, each brand index is associated with an ASCII brand identification string that identifies the official Intel family and model number of a processor.

When CPUID executes with EAX set to 1, the processor returns a brand index to the low byte in EBX. Software can then use this index to locate the brand identification string for the processor in the brand identification table. The first entry (brand index 0) in this table is reserved, allowing for backward compatibility with processors that do not support the brand identification feature. Starting with processor signature family ID = 0FH, model = 03H, brand index method is no longer supported. Use brand string method instead.

Table 3-23 shows brand indices that have identification strings associated with them.

Table 3-23. Mapping of Brand Indices; and Intel 64 and IA-32 Processor Brand Strings

| Brand Index | Brand String |
|-------------|---|
| 00H | This processor does not support the brand identification feature |
| 01H | Intel(R) Celeron(R) processor ¹ |
| 02H | Intel(R) Pentium(R) III processor ¹ |
| 03H | Intel(R) Pentium(R) III Xeon(R) processor; If processor signature = 000006B1h, then Intel(R) Celeron(R) processor |
| 04H | Intel(R) Pentium(R) III processor |
| 06H | Mobile Intel(R) Pentium(R) III processor-M |
| 07H | Mobile Intel(R) Celeron(R) processor ¹ |
| 08H | Intel(R) Pentium(R) 4 processor |
| 09H | Intel(R) Pentium(R) 4 processor |
| 0AH | Intel(R) Celeron(R) processor ¹ |
| 0BH | Intel(R) Xeon(R) processor; If processor signature = 00000F13h, then Intel(R) Xeon(R) processor MP |
| 0CH | Intel(R) Xeon(R) processor MP |
| 0EH | Mobile Intel(R) Pentium(R) 4 processor-M; If processor signature = 00000F13h, then Intel(R) Xeon(R) processor |
| 0FH | Mobile Intel(R) Celeron(R) processor ¹ |
| 11H | Mobile Genuine Intel(R) processor |
| 12H | Intel(R) Celeron(R) M processor |
| 13H | Mobile Intel(R) Celeron(R) processor ¹ |
| 14H | Intel(R) Celeron(R) processor |
| 15H | Mobile Genuine Intel(R) processor |
| 16H | Intel(R) Pentium(R) M processor |
| 17H | Mobile Intel(R) Celeron(R) processor ¹ |
| 18H – 0FFH | RESERVED |

NOTES:

1. Indicates versions of these processors that were introduced after the Pentium III

IA-32 Architecture Compatibility

CPUID is not supported in early models of the Intel486 processor or in any IA-32 processor earlier than the Intel486 processor.

Operation

Flags Affected

None.

Exceptions (All Operating Modes)

#UD

If the LOCK prefix is used.

In earlier IA-32 processors that do not support the CPUID instruction, execution of the instruction results in an invalid opcode (#UD) exception being generated.

CRC32—Accumulate CRC32 Value

| Opcode/ Instruction | | Op/ En | 64-Bit Mode | Compat/ Leg Mode | Description |
|------------------------|------------------------------|-----------|----------------|---------------------|----------------------------|
| F2 0F 38 F0 /r | CRC32 r32, r/m8 ¹ | RM | Valid | Valid | Accumulate CRC32 on r/m8. |
| F2 0F 38 F1 /r | CRC32 r32, r/m16 | RM | Valid | Valid | Accumulate CRC32 on r/m16. |
| F2 0F 38 F1 /r | CRC32 r32, r/m32 | RM | Valid | Valid | Accumulate CRC32 on r/m32. |
| F2 REX.W 0F 38 F0 /r | CRC32 r64, r/m8 | RM | Valid | N.E. | Accumulate CRC32 on r/m8. |
| F2 REX.W 0F 38 F1 /r | CRC32 r64, r/m64 | RM | Valid | N.E. | Accumulate CRC32 on r/m64. |

NOTES:

1. With a REX prefix in 64-bit mode, attempts to access AH, BH, CH, or DH will instead access SPL, DIL, BPL, or SIL, respectively.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------------|---------------|-----------|-----------|
| RM | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |

Description

Starting with an initial value in the first operand (destination operand), accumulates a CRC32 (polynomial 11EDC6F41H) value for the second operand (source operand) and stores the result in the destination operand. The source operand can be a register or a memory location. The destination operand must be an r32 or r64 register. If the destination is an r64 register, then the 32-bit result is stored in the least significant double word and 00000000H is stored in the most significant double word of the r64 register.

The initial value supplied in the destination operand is a double word integer stored in the r32 register or the least significant double word of the r64 register. To incrementally accumulate a CRC32 value, software retains the result of the previous CRC32 operation in the destination operand, then executes the CRC32 instruction again with new input data in the source operand. Data contained in the source operand is processed in reflected bit order. This means that the most significant bit of the source operand is treated as the least significant bit of the quotient, and so on, for all the bits of the source operand. Likewise, the result of the CRC operation is stored in the destination operand in reflected bit order. This means that the most significant bit of the resulting CRC (bit 31) is stored in the least significant bit of the destination operand (bit 0), and so on, for all the bits of the CRC.

Operation

Notes:

BIT_REFLECT64: DST[63-0] = SRC[0-63]

BIT_REFLECT32: DST[31-0] = SRC[0-31]

BIT_REFLECT16: DST[15-0] = SRC[0-15]

BIT_REFLECT8: DST[7-0] = SRC[0-7]

MOD2: Remainder from Polynomial division modulus 2

CRC32 instruction for 64-bit source operand and 64-bit destination operand:

```
TEMP1[63-0] := BIT_REFLECT64 (SRC[63-0])
TEMP2[31-0] := BIT_REFLECT32 (DEST[31-0])
TEMP3[95-0] := TEMP1[63-0] « 32
TEMP4[95-0] := TEMP2[31-0] « 64
TEMP5[95-0] := TEMP3[95-0] XOR TEMP4[95-0]
TEMP6[31-0] := TEMP5[95-0] MOD2 11EDC6F41H
DEST[31-0] := BIT_REFLECT (TEMP6[31-0])
DEST[63-32] := 00000000H
```

CRC32 instruction for 32-bit source operand and 32-bit destination operand:

```
TEMP1[31-0] := BIT_REFLECT32 (SRC[31-0])
TEMP2[31-0] := BIT_REFLECT32 (DEST[31-0])
TEMP3[63-0] := TEMP1[31-0] « 32
TEMP4[63-0] := TEMP2[31-0] « 32
TEMP5[63-0] := TEMP3[63-0] XOR TEMP4[63-0]
TEMP6[31-0] := TEMP5[63-0] MOD2 11EDC6F41H
DEST[31-0] := BIT_REFLECT (TEMP6[31-0])
```

CRC32 instruction for 16-bit source operand and 32-bit destination operand:

```
TEMP1[15-0] := BIT_REFLECT16 (SRC[15-0])
TEMP2[31-0] := BIT_REFLECT32 (DEST[31-0])
TEMP3[47-0] := TEMP1[15-0] « 32
TEMP4[47-0] := TEMP2[31-0] « 16
TEMP5[47-0] := TEMP3[47-0] XOR TEMP4[47-0]
TEMP6[31-0] := TEMP5[47-0] MOD2 11EDC6F41H
DEST[31-0] := BIT_REFLECT (TEMP6[31-0])
```

CRC32 instruction for 8-bit source operand and 64-bit destination operand:

```
TEMP1[7-0] := BIT_REFLECT8 (SRC[7-0])
TEMP2[31-0] := BIT_REFLECT32 (DEST[31-0])
TEMP3[39-0] := TEMP1[7-0] « 32
TEMP4[39-0] := TEMP2[31-0] « 8
TEMP5[39-0] := TEMP3[39-0] XOR TEMP4[39-0]
TEMP6[31-0] := TEMP5[39-0] MOD2 11EDC6F41H
DEST[31-0] := BIT_REFLECT (TEMP6[31-0])
DEST[63-32] := 00000000H
```

CRC32 instruction for 8-bit source operand and 32-bit destination operand:

```
TEMP1[7-0] := BIT_REFLECT8 (SRC[7-0])
TEMP2[31-0] := BIT_REFLECT32 (DEST[31-0])
TEMP3[39-0] := TEMP1[7-0] « 32
TEMP4[39-0] := TEMP2[31-0] « 8
TEMP5[39-0] := TEMP3[39-0] XOR TEMP4[39-0]
TEMP6[31-0] := TEMP5[39-0] MOD2 11EDC6F41H
DEST[31-0] := BIT_REFLECT (TEMP6[31-0])
```

Flags Affected

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------|---------------|---------------|-----------|-----------|
| A | N/A | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |
| B | Half | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Converts two, four or eight packed signed doubleword integers in the source operand (the second operand) to two, four or eight packed double precision floating-point values in the destination operand (the first operand).

EVEX encoded versions: The source operand can be a YMM/XMM/XMM (low 64 bits) register, a 256/128/64-bit memory location or a 256/128/64-bit vector broadcasted from a 32-bit memory location. The destination operand is a ZMM/YMM/XMM register conditionally updated with writemask k1. Attempt to encode this instruction with EVEX embedded rounding is ignored.

VEX.256 encoded version: The source operand is an XMM register or 128-bit memory location. The destination operand is a YMM register.

VEX.128 encoded version: The source operand is an XMM register or 64-bit memory location. The destination operand is a XMM register. The upper Bits (MAXVL-1:128) of the corresponding ZMM register destination are zeroed.

128-bit Legacy SSE version: The source operand is an XMM register or 64-bit memory location. The destination operand is an XMM register. The upper Bits (MAXVL-1:128) of the corresponding ZMM register destination are unmodified.

VEX.vvvv and EVEX.vvvv are reserved and must be 1111b, otherwise instructions will #UD.

Description

Converts four, eight or sixteen packed signed doubleword integers in the source operand to four, eight or sixteen packed single precision floating-point values in the destination operand.

EVEX encoded versions: The source operand can be a ZMM/YMM/XMM register, a 512/256/128-bit memory location or a 512/256/128-bit vector broadcasted from a 32-bit memory location. The destination operand is a ZMM/YMM/XMM register conditionally updated with writemask k1.

VEX.256 encoded version: The source operand is a YMM register or 256-bit memory location. The destination operand is a YMM register. Bits (MAXVL-1:256) of the corresponding register destination are zeroed.

VEX.128 encoded version: The source operand is an XMM register or 128-bit memory location. The destination operand is a XMM register. The upper bits (MAXVL-1:128) of the corresponding register destination are zeroed.

128-bit Legacy SSE version: The source operand is an XMM register or 128-bit memory location. The destination operand is an XMM register. The upper Bits (MAXVL-1:128) of the corresponding register destination are unmodified.

VEX.vvvv and EVEX.vvvv are reserved and must be 1111b, otherwise instructions will #UD.

| B | Full | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Converts packed double precision floating-point values in the source operand (second operand) to packed signed doubleword integers in the destination operand (first operand).

When a conversion is inexact, the value returned is rounded according to the rounding control bits in the MXCSR register or the embedded rounding control bits. If a converted result cannot be represented in the destination format, the floating-point invalid exception is raised, and if this exception is masked, the indefinite integer value 80000000H is returned.

EVEX encoded versions: The source operand is a ZMM/YMM/XMM register, a 512-bit memory location, or a 512-bit vector broadcasted from a 64-bit memory location. The destination operand is a ZMM/YMM/XMM register conditionally updated with writemask k1. The upper bits (MAXVL-1:256/128/64) of the corresponding destination are zeroed.

VEX.256 encoded version: The source operand is a YMM register or 256-bit memory location. The destination operand is an XMM register. The upper bits (MAXVL-1:128) of the corresponding ZMM register destination are zeroed.

VEX.128 encoded version: The source operand is an XMM register or 128-bit memory location. The destination operand is a XMM register. The upper bits (MAXVL-1:64) of the corresponding ZMM register destination are zeroed.

128-bit Legacy SSE version: The source operand is an XMM register or 128-bit memory location. The destination operand is an XMM register. Bits[127:64] of the destination XMM register are zeroed. However, the upper bits (MAXVL-1:128) of the corresponding ZMM register destination are unmodified.

VEX.vvvv and EVEX.vvvv are reserved and must be 1111b, otherwise instructions will #UD.

CVTPD2PI—Convert Packed Double Precision Floating-Point Values to Packed Dword Integers

| Opcode/ Instruction | Op/ En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|--------------------------------------|-----------|------------------------------|--------------------------|---|
| 66 0F 2D /r CVTPD2PI mm, xmm/m128 | RM | V/V | SSE2 | Convert two packed double precision floating-point values from xmm/m128 to two packed signed doubleword integers in mm. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|-----------|-----------|
| RM | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Converts two packed double precision floating-point values in the source operand (second operand) to two packed signed doubleword integers in the destination operand (first operand).

The source operand can be an XMM register or a 128-bit memory location. The destination operand is an MMX technology register.

When a conversion is inexact, the value returned is rounded according to the rounding control bits in the MXCSR register. If a converted result is larger than the maximum signed doubleword integer, the floating-point invalid exception is raised, and if this exception is masked, the indefinite integer value 80000000H is returned.

This instruction causes a transition from x87 FPU to MMX technology operation (that is, the x87 FPU top-of-stack pointer is set to 0 and the x87 FPU tag word is set to all 0s [valid]). If this instruction is executed while an x87 FPU floating-point exception is pending, the exception is handled before the CVTPD2PI instruction is executed.

In 64-bit mode, use of the REX.R prefix permits this instruction to access additional registers (XMM8-XMM15).

Operation

DEST[31:0] := Convert_Double_Precision_Floating_Point_To_Integer32(SRC[63:0]);

DEST[63:32] := Convert_Double_Precision_Floating_Point_To_Integer32(SRC[127:64]);

CVTPI2PD—Convert Packed Dword Integers to Packed Double Precision Floating-Point Values

| Opcode/ Instruction | Op/ En | 64-Bit Mode | Compat/ Leg Mode | Description |
|--|-----------|----------------|---------------------|--|
| 66 0F 2A /r CVTPI2PD xmm, mm/m64 ¹ | RM | Valid | Valid | Convert two packed signed doubleword integers from mm/mem64 to two packed double precision floating-point values in xmm. |

NOTES:

1. Operation is different for different operand sets; see the Description section.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|-----------|-----------|
| RM | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Converts two packed signed doubleword integers in the source operand (second operand) to two packed double precision floating-point values in the destination operand (first operand).

The source operand can be an MMX technology register or a 64-bit memory location. The destination operand is an XMM register. In addition, depending on the operand configuration:

- **For operands *xmm*, *mm*:** the instruction causes a transition from x87 FPU to MMX technology operation (that is, the x87 FPU top-of-stack pointer is set to 0 and the x87 FPU tag word is set to all 0s [valid]). If this instruction is executed while an x87 FPU floating-point exception is pending, the exception is handled before the CVTPI2PD instruction is executed.
- **For operands *xmm*, *m64*:** the instruction does not cause a transition to MMX technology and does not take x87 FPU exceptions.

In 64-bit mode, use of the REX.R prefix permits this instruction to access additional registers (XMM8-XMM15).

Operation

DEST[63:0] := Convert_Integer_To_Double_Precision_Floating_Point(SRC[31:0]);

DEST[127:64] := Convert_Integer_To_Double_Precision_Floating_Point(SRC[63:32]);

CVTPI2PS—Convert Packed Dword Integers to Packed Single Precision Floating-Point Values

| Opcode/ Instruction | Op/ En | 64-Bit Mode | Compat/ Leg Mode | Description |
|-------------------------------------|-----------|----------------|---------------------|--|
| NP OF 2A /r CVTPI2PS xmm, mm/m64 | RM | Valid | Valid | Convert two signed doubleword integers from mm/m64 to two single precision floating-point values in xmm. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------------|---------------|-----------|-----------|
| RM | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |

Description

Converts two packed signed doubleword integers in the source operand (second operand) to two packed single precision floating-point values in the destination operand (first operand).

The source operand can be an MMX technology register or a 64-bit memory location. The destination operand is an XMM register. The results are stored in the low quadword of the destination operand, and the high quadword remains unchanged. When a conversion is inexact, the value returned is rounded according to the rounding control bits in the MXCSR register.

This instruction causes a transition from x87 FPU to MMX technology operation (that is, the x87 FPU top-of-stack pointer is set to 0 and the x87 FPU tag word is set to all 0s [valid]). If this instruction is executed while an x87 FPU floating-point exception is pending, the exception is handled before the CVTPI2PS instruction is executed.

In 64-bit mode, use of the REX.R prefix permits this instruction to access additional registers (XMM8-XMM15).

Operation

```
DEST[31:0] := Convert_Integer_To_Single_Precision_Floating_Point(SRC[31:0]);  
DEST[63:32] := Convert_Integer_To_Single_Precision_Floating_Point(SRC[63:32]);  
(* High quadword of destination unchanged *)

| B | Full | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Converts four, eight or sixteen packed single precision floating-point values in the source operand to four, eight or sixteen signed doubleword integers in the destination operand.

When a conversion is inexact, the value returned is rounded according to the rounding control bits in the MXCSR register or the embedded rounding control bits. If a converted result cannot be represented in the destination format, the floating-point invalid exception is raised, and if this exception is masked, the indefinite integer value 80000000H is returned.

EVEX encoded versions: The source operand is a ZMM register, a 512-bit memory location or a 512-bit vector broadcasted from a 32-bit memory location. The destination operand is a ZMM register conditionally updated with writemask k1.

VEX.256 encoded version: The source operand is a YMM register or 256-bit memory location. The destination operand is a YMM register. The upper bits (MAXVL-1:256) of the corresponding ZMM register destination are zeroed.

VEX.128 encoded version: The source operand is an XMM register or 128-bit memory location. The destination operand is an XMM register. The upper bits (MAXVL-1:128) of the corresponding ZMM register destination are zeroed.

128-bit Legacy SSE version: The source operand is an XMM register or 128-bit memory location. The destination operand is an XMM register. The upper bits (MAXVL-1:128) of the corresponding ZMM register destination are unmodified.

VEX.vvvv and EVEX.vvvv are reserved and must be 1111b otherwise instructions will #UD.

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------|---------------|---------------|-----------|-----------|
| A | N/A | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |
| B | Half | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Converts two, four or eight packed single precision floating-point values in the source operand (second operand) to two, four or eight packed double precision floating-point values in the destination operand (first operand).

EVEX encoded versions: The source operand is a YMM/XMM/XMM (low 64-bits) register, a 256/128/64-bit memory location or a 256/128/64-bit vector broadcasted from a 32-bit memory location. The destination operand is a ZMM/YMM/XMM register conditionally updated with writemask k1.

VEX.256 encoded version: The source operand is an XMM register or 128-bit memory location. The destination operand is a YMM register. Bits (MAXVL-1:256) of the corresponding destination ZMM register are zeroed.

VEX.128 encoded version: The source operand is an XMM register or 64-bit memory location. The destination operand is a XMM register. The upper Bits (MAXVL-1:128) of the corresponding ZMM register destination are zeroed.

128-bit Legacy SSE version: The source operand is an XMM register or 64-bit memory location. The destination operand is an XMM register. The upper Bits (MAXVL-1:128) of the corresponding ZMM register destination are unmodified.

Note: VEX.vvvv and EVEX.vvvv are reserved and must be 1111b otherwise instructions will #UD.

CVTPS2PI—Convert Packed Single Precision Floating-Point Values to Packed Dword Integers

| Opcode/ Instruction | Op/ En | 64-Bit Mode | Compat/ Leg Mode | Description |
|-------------------------------------|-----------|----------------|---------------------|--|
| NP OF 2D /r CVTPS2PI mm, xmm/m64 | RM | Valid | Valid | Convert two packed single precision floating-point values from xmm/m64 to two packed signed doubleword integers in mm. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|-----------|-----------|
| RM | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Converts two packed single precision floating-point values in the source operand (second operand) to two packed signed doubleword integers in the destination operand (first operand).

The source operand can be an XMM register or a 128-bit memory location. The destination operand is an MMX technology register. When the source operand is an XMM register, the two single precision floating-point values are contained in the low quadword of the register. When a conversion is inexact, the value returned is rounded according to the rounding control bits in the MXCSR register. If a converted result is larger than the maximum signed doubleword integer, the floating-point invalid exception is raised, and if this exception is masked, the indefinite integer value 80000000H is returned.

CVTPS2PI causes a transition from x87 FPU to MMX technology operation (that is, the x87 FPU top-of-stack pointer is set to 0 and the x87 FPU tag word is set to all 0s [valid]). If this instruction is executed while an x87 FPU floating-point exception is pending, the exception is handled before the CVTPS2PI instruction is executed.

In 64-bit mode, use of the REX.R prefix permits this instruction to access additional registers (XMM8-XMM15).

Operation

```
DEST[31:0] := Convert_Single_Precision_Floating_Point_To_Integer(SRC[31:0]);
DEST[63:32] := Convert_Single_Precision_Floating_Point_To_Integer(SRC[63:32]);
```

Intel C/C++ Compiler Intrinsic Equivalent

| F2 REX.W 0F 2D /r CVTSD2SI r64, xmm1/m64 | A | V/N.E. | SSE2 | Convert one double precision floating-point value from xmm1/m64 to one signed quadword integer sign-extended into r64. |
| VEX.LIG.F2.0F.W0 2D /r ¹ VCVTSD2SI r32, xmm1/m64 | A | V/V | AVX | Convert one double precision floating-point value from xmm1/m64 to one signed doubleword integer r32. |
| VEX.LIG.F2.0F.W1 2D /r ¹ VCVTSD2SI r64, xmm1/m64 | A | V/N.E. ² | AVX | Convert one double precision floating-point value from xmm1/m64 to one signed quadword integer sign-extended into r64. |
| EVEX.LLIG.F2.0F.W0 2D /r VCVTSD2SI r32, xmm1/m64{er} | B | V/V | AVX512F OR AVX10.1 | Convert one double precision floating-point value from xmm1/m64 to one signed doubleword integer r32. |
| EVEX.LLIG.F2.0F.W1 2D /r VCVTSD2SI r64, xmm1/m64{er} | B | V/N.E. ² | AVX512F OR AVX10.1 | Convert one double precision floating-point value from xmm1/m64 to one signed quadword integer sign-extended into r64. |

NOTES:

1. Software should ensure VCVTSD2SI is encoded with VEX.L=0. Encoding VCVTSD2SI with VEX.L=1 may encounter unpredictable behavior across different processor generations.
2. VEX.W1/EVEX.W1 in non-64 bit is ignored; the instructions behaves as if the W0 version is used.

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|--------------|---------------|---------------|-----------|-----------|
| A | N/A | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |
| B | Tuple1 Fixed | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Converts a double precision floating-point value in the source operand (the second operand) to a signed integer in the destination operand (first operand). The source operand can be an XMM register or a 64-bit memory location. The destination operand is a general-purpose register. When the source operand is an XMM register, the double precision floating-point value is contained in the low quadword of the register.

When a conversion is inexact, the value returned is rounded according to the rounding control bits in the MXCSR register.

If a converted result exceeds the range limits of signed doubleword integer (in non-64-bit modes or 64-bit mode with REX.W/VEX.W/EVEX.W=0), the floating-point invalid exception is raised, and if this exception is masked, the indefinite integer value **80000000H** is returned.

If a converted result exceeds the range limits of signed quadword integer (in 64-bit mode and REX.W/VEX.W/EVEX.W = 1), the floating-point invalid exception is raised, and if this exception is masked, the indefinite integer value **80000000_00000000H** is returned.

Legacy SSE instruction: Use of the REX.W prefix promotes the instruction to produce 64-bit data in 64-bit mode. See the summary chart at the beginning of this section for encoding data and limits.

Note: VEX.vvvv and EVEX.vvvv are reserved and must be 1111b, otherwise instructions will #UD.

Software should ensure VCVTSD2SI is encoded with VEX.L=0. Encoding VCVTSD2SI with VEX.L=1 may encounter unpredictable behavior across different processor generations.

Operation

| C | Tuple1 Scalar | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | N/A |

Description

Converts a double precision floating-point value in the “convert-from” source operand (the second operand in SSE2 version, otherwise the third operand) to a single precision floating-point value in the destination operand.

When the “convert-from” operand is an XMM register, the double precision floating-point value is contained in the low quadword of the register. The result is stored in the low doubleword of the destination operand. When the conversion is inexact, the value returned is rounded according to the rounding control bits in the MXCSR register.

128-bit Legacy SSE version: The “convert-from” source operand (the second operand) is an XMM register or memory location. Bits (MAXVL-1:32) of the corresponding destination register remain unchanged. The destination operand is an XMM register.

VEX.128 and EVEX encoded versions: The “convert-from” source operand (the third operand) can be an XMM register or a 64-bit memory location. The first source and destination operands are XMM registers. Bits (127:32) of the XMM register destination are copied from the corresponding bits in the first source operand. Bits (MAXVL-1:128) of the destination register are zeroed.

EVEX encoded version: the converted result is written to the low doubleword element of the destination under the writemask.

Software should ensure VCVTSD2SS is encoded with VEX.L=0. Encoding VCVTSD2SS with VEX.L=1 may encounter unpredictable behavior across different processor generations.

Operation

VCVTSD2SS (EVEX Encoded Version)

```
IF (SRC2 *is register*) AND (EVEX.b = 1)
    THEN
        SET_ROUNDING_MODE_FOR_THIS_INSTRUCTION(EVEX.RC);
    ELSE

NOTES:

1. VEX.W1/EVEX.W1 in non-64 bit is ignored; the instructions behaves as if the W0 version is used.

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|---------------|---------------|-----------|
| A | N/A | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |
| B | N/A | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | N/A |
| C | Tuple1 Scalar | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | N/A |

Description

Converts a signed doubleword or quadword integer in the “convert-from” source operand to a double precision floating-point value in the destination operand. The result is stored in the low quadword of the destination operand, and the high quadword left unchanged. When conversion is inexact, the value returned is rounded according to the rounding control bits in the MXCSR register.

The second source operand can be a general-purpose register or a 32/64-bit memory location. The first source and destination operands are XMM registers.

128-bit Legacy SSE version: Use of the REX.W prefix promotes the instruction to 64-bit operands. The “convert-from” source operand (the second operand) is a general-purpose register or memory location. The destination is an XMM register Bits (MAXVL-1:64) of the corresponding destination register remain unchanged.

VEX.128 and EVEX encoded versions: The “convert-from” source operand (the third operand) can be a general-purpose register or a memory location. The first source and destination operands are XMM registers. Bits (127:64) of the XMM register destination are copied from the corresponding bits in the first source operand. Bits (MAXVL-1:128) of the destination register are zeroed.

EVEX.W0 version: attempt to encode this instruction with EVEX embedded rounding is ignored.

VEX.W1 and EVEX.W1 versions: promotes the instruction to use 64-bit input value in 64-bit mode.

Software should ensure VCVTSI2SD is encoded with VEX.L=0. Encoding VCVTSI2SD with VEX.L=1 may encounter unpredictable behavior across different processor generations.

Operation

VCVTSI2SD (EVEX Encoded Version)

```

| C | Tuple1 Scalar | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | N/A |

Description

Converts a signed doubleword or quadword integer in the “convert-from” source operand to a single precision floating-point value in the destination operand (first operand). The “convert-from” source operand can be a general-purpose register or a memory location. The destination operand is an XMM register. The result is stored in the low doubleword of the destination operand, and the upper three doublewords are left unchanged. When a conversion is inexact, the value returned is rounded according to the rounding control bits in the MXCSR register or the embedded rounding control bits.

128-bit Legacy SSE version: In 64-bit mode, Use of the REX.W prefix promotes the instruction to use 64-bit input value. The “convert-from” source operand (the second operand) is a general-purpose register or memory location. Bits (MAXVL-1:32) of the corresponding destination register remain unchanged.

VEX.128 and EVEX encoded versions: The “convert-from” source operand (the third operand) can be a general-purpose register or a memory location. The first source and destination operands are XMM registers. Bits (127:32) of the XMM register destination are copied from corresponding bits in the first source operand. Bits (MAXVL-1:128) of the destination register are zeroed.

EVEX encoded version: the converted result is written to the low doubleword element of the destination under the writemask.

Software should ensure VCVTSI2SS is encoded with VEX.L=0. Encoding VCVTSI2SS with VEX.L=1 may encounter unpredictable behavior across different processor generations.

Operation

NOTES:

1. Software should ensure VCVTSS2SI is encoded with VEX.L=0. Encoding VCVTSS2SI with VEX.L=1 may encounter unpredictable behavior across different processor generations.
2. VEX.W1/EVEX.W1 in non-64 bit is ignored; the instructions behaves as if the W0 version is used.

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|--------------|---------------|---------------|-----------|-----------|
| A | N/A | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |
| B | Tuple1 Fixed | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Converts a single precision floating-point value in the source operand (the second operand) to a signed integer in the destination operand (the first operand). The source operand can be an XMM register or a memory location. The destination operand is a general-purpose register. When the source operand is an XMM register, the single precision floating-point value is contained in the low doubleword of the register.

When a conversion is inexact, the value returned is rounded according to the rounding control bits in the MXCSR register or the embedded rounding control bits.

If a converted result exceeds the range limits of signed doubleword integer (in non-64-bit modes or 64-bit mode with REX.W/VEX.W/EVEX.W=0), the floating-point invalid exception is raised, and if this exception is masked, the indefinite integer value 80000000H is returned.

If a converted result exceeds the range limits of signed quadword integer (in 64-bit mode and REX.W/VEX.W/EVEX.W = 1), the floating-point invalid exception is raised, and if this exception is masked, the indefinite integer value 80000000_00000000H is returned.

Legacy SSE instructions: In 64-bit mode, Use of the REX.W prefix promotes the instruction to produce 64-bit data. See the summary chart at the beginning of this section for encoding data and limits.

VEX.W1 and EVEX.W1 versions: promotes the instruction to produce 64-bit data in 64-bit mode.

Note: VEX.vvvv and EVEX.vvvv are reserved and must be 1111b, otherwise instructions will #UD.

Software should ensure VCVTSS2SI is encoded with VEX.L=0. Encoding VCVTSS2SI with VEX.L=1 may encounter unpredictable behavior across different processor generations.

Operation

VCVTSS2SI (EVEX Encoded Version)

```
IF (SRC *is register*) AND (EVEX.b = 1)
    THEN
        SET_ROUNDING_MODE_FOR_THIS_INSTRUCTION(EVEX.RC);

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------|---------------|---------------|-----------|-----------|
| A | N/A | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |
| B | Full | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Converts two, four or eight packed double precision floating-point values in the source operand (second operand) to two, four or eight packed signed doubleword integers in the destination operand (first operand).

When a conversion is inexact, a truncated (round toward zero) value is returned. If a converted result is larger than the maximum signed doubleword integer, the floating-point invalid exception is raised, and if this exception is masked, the indefinite integer value 80000000H is returned.

EVEX encoded versions: The source operand is a ZMM/YMM/XMM register, a 512/256/128-bit memory location, or a 512/256/128-bit vector broadcasted from a 64-bit memory location. The destination operand is a YMM/XMM/XMM (low 64 bits) register conditionally updated with writemask k1. The upper bits (MAXVL-1:256) of the corresponding destination are zeroed.

VEX.256 encoded version: The source operand is a YMM register or 256-bit memory location. The destination operand is an XMM register. The upper bits (MAXVL-1:128) of the corresponding ZMM register destination are zeroed.

VEX.128 encoded version: The source operand is an XMM register or 128-bit memory location. The destination operand is a XMM register. The upper bits (MAXVL-1:64) of the corresponding ZMM register destination are zeroed.

128-bit Legacy SSE version: The source operand is an XMM register or 128-bit memory location. The destination operand is an XMM register. The upper bits (MAXVL-1:128) of the corresponding ZMM register destination are unmodified.

Note: VEX.vvvv and EVEX.vvvv are reserved and must be 1111b, otherwise instructions will #UD.

CVTTPD2PI—Convert With Truncation Packed Double Precision Floating-Point Values to Packed Dword Integers

| Opcode/ Instruction | Op/ En | 64-Bit Mode | Compat/ Leg Mode | Description |
|---------------------------------------|-----------|----------------|---------------------|--|
| 66 0F 2C /r CVTTPD2PI mm, xmm/m128 | RM | Valid | Valid | Convert two packed double precision floating-point values from xmm/m128 to two packed signed doubleword integers in mm using truncation. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|-----------|-----------|
| RM | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Converts two packed double precision floating-point values in the source operand (second operand) to two packed signed doubleword integers in the destination operand (first operand). The source operand can be an XMM register or a 128-bit memory location. The destination operand is an MMX technology register.

When a conversion is inexact, a truncated (round toward zero) result is returned. If a converted result is larger than the maximum signed doubleword integer, the floating-point invalid exception is raised, and if this exception is masked, the indefinite integer value 80000000H is returned.

This instruction causes a transition from x87 FPU to MMX technology operation (that is, the x87 FPU top-of-stack pointer is set to 0 and the x87 FPU tag word is set to all 0s [valid]). If this instruction is executed while an x87 FPU floating-point exception is pending, the exception is handled before the CVTTPD2PI instruction is executed.

In 64-bit mode, use of the REX.R prefix permits this instruction to access additional registers (XMM8-XMM15).

Operation

```
DEST[31:0] := Convert_Double_Precision_Floating_Point_To_Integer32_Truncate(SRC[63:0]);
DEST[63:32] := Convert_Double_Precision_Floating_Point_To_Integer32_Truncate(SRC[127:64]);
```

CVTTPS2PI—Convert With Truncation Packed Single Precision Floating-Point Values to Packed Dword Integers

| Opcode/ Instruction | Op/ En | 64-Bit Mode | Compat/ Leg Mode | Description |
|--------------------------------------|-----------|----------------|---------------------|--|
| NP 0F 2C /r CVTTPS2PI mm, xmm/m64 | RM | Valid | Valid | Convert two single precision floating-point values from xmm/m64 to two signed doubleword signed integers in mm using truncation. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|-----------|-----------|
| RM | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Converts two packed single precision floating-point values in the source operand (second operand) to two packed signed doubleword integers in the destination operand (first operand). The source operand can be an XMM register or a 64-bit memory location. The destination operand is an MMX technology register. When the source operand is an XMM register, the two single precision floating-point values are contained in the low quadword of the register.

When a conversion is inexact, a truncated (round toward zero) result is returned. If a converted result is larger than the maximum signed doubleword integer, the floating-point invalid exception is raised, and if this exception is masked, the indefinite integer value 80000000H is returned.

This instruction causes a transition from x87 FPU to MMX technology operation (that is, the x87 FPU top-of-stack pointer is set to 0 and the x87 FPU tag word is set to all 0s [valid]). If this instruction is executed while an x87 FPU floating-point exception is pending, the exception is handled before the CVTTPS2PI instruction is executed.

In 64-bit mode, use of the REX.R prefix permits this instruction to access additional registers (XMM8-XMM15).

Operation

```
DEST[31:0] := Convert_Single_Precision_Floating_Point_To_Integer_Truncate(SRC[31:0]);  
DEST[63:32] := Convert_Single_Precision_Floating_Point_To_Integer_Truncate(SRC[63:32]);
```

| A | N/A | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |
| B | Tuple1 Fixed | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Converts a double precision floating-point value in the source operand (the second operand) to a signed doubleword integer (or signed quadword integer if operand size is 64 bits) in the destination operand (the first operand). The source operand can be an XMM register or a 64-bit memory location. The destination operand is a general purpose register. When the source operand is an XMM register, the double precision floating-point value is contained in the low quadword of the register.

When a conversion is inexact, the value returned is rounded according to the rounding control bits in the MXCSR register.

If a converted result exceeds the range limits of signed doubleword integer (in non-64-bit modes or 64-bit mode with REX.W/VEX.W/EVEX.W=0), the floating-point invalid exception is raised, and if this exception is masked, the indefinite integer value 80000000H is returned.

If a converted result exceeds the range limits of signed quadword integer (in 64-bit mode and REX.W/VEX.W/EVEX.W = 1), the floating-point invalid exception is raised, and if this exception is masked, the indefinite integer value 80000000_00000000H is returned.

Legacy SSE instructions: In 64-bit mode, Use of the REX.W prefix promotes the instruction to 64-bit operation. See the summary chart at the beginning of this section for encoding data and limits.

VEX.W1 and EVEX.W1 versions: promotes the instruction to produce 64-bit data in 64-bit mode.

Note: VEX.vvvv and EVEX.vvvv are reserved and must be 1111b, otherwise instructions will #UD.
Software should ensure VCVTTSD2SI is encoded with VEX.L=0. Encoding VCVTTSD2SI with VEX.L=1 may encounter unpredictable behavior across different processor generations.

Operation

SIMD Floating-Point Exceptions

Invalid, Precision.

Other Exceptions

VEX-encoded instructions, see Table 2-20, “Type 3 Class Exception Conditions,” additionally:

#UD If VEX.vvvv != 1111B.

EVEX-encoded instructions, see Table 2-50, “Type E3NF Class Exception Conditions.”

CVTTSS2SI—Convert With Truncation Scalar Single Precision Floating-Point Value to Signed Integer

| Opcode/ Instruction | Op / En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|---|------------|------------------------------|-----------------------|---|
| F3 OF 2C /r CVTTSS2SI r32, xmm1/m32 | A | V/V | SSE | Convert one single precision floating-point value from xmm1/m32 to one signed doubleword integer in r32 using truncation. |
| F3 REX.W OF 2C /r CVTTSS2SI r64, xmm1/m32 | A | V/N.E. | SSE | Convert one single precision floating-point value from xmm1/m32 to one signed quadword integer in r64 using truncation. |
| VEX.LIG.F3.OF.W0 2C /r ¹ VCVTTSS2SI r32, xmm1/m32 | A | V/V | AVX | Convert one single precision floating-point value from xmm1/m32 to one signed doubleword integer in r32 using truncation. |
| VEX.LIG.F3.OF.W1 2C /r ¹ VCVTTSS2SI r64, xmm1/m32 | A | V/N.E. ² | AVX | Convert one single precision floating-point value from xmm1/m32 to one signed quadword integer in r64 using truncation. |
| EVEX.LLIG.F3.OF.W0 2C /r VCVTTSS2SI r32, xmm1/m32{sae} | B | V/V | AVX512F OR AVX10.1 | Convert one single precision floating-point value from xmm1/m32 to one signed doubleword integer in r32 using truncation. |
| EVEX.LLIG.F3.OF.W1 2C /r VCVTTSS2SI r64, xmm1/m32{sae} | B | V/N.E. ² | AVX512F OR AVX10.1 | Convert one single precision floating-point value from xmm1/m32 to one signed quadword integer in r64 using truncation. |

NOTES:

1. Software should ensure VCVTTSS2SI is encoded with VEX.L=0. Encoding VCVTTSS2SI with VEX.L=1 may encounter unpredictable behavior across different processor generations.
2. For this specific instruction, VEX.W/EVEX.W in non-64 bit is ignored; the instructions behaves as if the W0 version is used.

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|--------------|---------------|---------------|-----------|-----------|
| A | N/A | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |
| B | Tuple1 Fixed | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Converts a single precision floating-point value in the source operand (the second operand) to a signed doubleword integer (or signed quadword integer if operand size is 64 bits) in the destination operand (the first operand). The source operand can be an XMM register or a 32-bit memory location. The destination operand is a general purpose register. When the source operand is an XMM register, the single precision floating-point value is contained in the low doubleword of the register.

When a conversion is inexact, a truncated (round toward zero) result is returned.

If a converted result exceeds the range limits of signed doubleword integer (in non-64-bit modes or 64-bit mode with REX.W/VEX.W/EVEX.W=0), the floating-point invalid exception is raised, and if this exception is masked, the indefinite integer value 80000000H is returned.

If a converted result exceeds the range limits of signed quadword integer (in 64-bit mode and REX.W/VEX.W/EVEX.W = 1), the floating-point invalid exception is raised, and if this exception is masked, the indefinite integer value 80000000_00000000H is returned.

Legacy SSE instructions: In 64-bit mode, Use of the REX.W prefix promotes the instruction to 64-bit operation. See the summary chart at the beginning of this section for encoding data and limits.

VEX.W1 and EVEX.W1 versions: promotes the instruction to produce 64-bit data in 64-bit mode.

Note: VEX.vvvv and EVEX.vvvv are reserved and must be 1111b, otherwise instructions will #UD.
Software should ensure VCVTSS2SI is encoded with VEX.L=0. Encoding VCVTSS2SI with VEX.L=1 may encounter unpredictable behavior across different processor generations.

CWD/CDQ/CQO—Convert Word to Doubleword/Convert Doubleword to Quadword

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|------------|-------------|-------|-------------|-----------------|--------------------------------|
| 99 | CWD | Z0 | Valid | Valid | DX:AX := sign-extend of AX. |
| 99 | CDQ | Z0 | Valid | Valid | EDX:EAX := sign-extend of EAX. |
| REX.W + 99 | CQO | Z0 | Valid | N.E. | RDX:RAX:= sign-extend of RAX. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Doubles the size of the operand in register AX, EAX, or RAX (depending on the operand size) by means of sign extension and stores the result in registers DX:AX, EDX:EAX, or RDX:RAX, respectively. The CWD instruction copies the sign (bit 15) of the value in the AX register into every bit position in the DX register. The CDQ instruction copies the sign (bit 31) of the value in the EAX register into every bit position in the EDX register. The CQO instruction (available in 64-bit mode only) copies the sign (bit 63) of the value in the RAX register into every bit position in the RDX register.

The CWD instruction can be used to produce a doubleword dividend from a word before word division. The CDQ instruction can be used to produce a quadword dividend from a doubleword before doubleword division. The CQO instruction can be used to produce a double quadword dividend from a quadword before a quadword division.

The CWD and CDQ mnemonics reference the same opcode. The CWD instruction is intended for use when the operand-size attribute is 16 and the CDQ instruction for when the operand-size attribute is 32. Some assemblers may force the operand size to 16 when CWD is used and to 32 when CDQ is used. Others may treat these mnemonics as synonyms (CWD/CDQ) and use the current setting of the operand-size attribute to determine the size of values to be converted, regardless of the mnemonic used.

In 64-bit mode, use of the REX.W prefix promotes operation to 64 bits. The CQO mnemonics reference the same opcode as CWD/CDQ. See the summary chart at the beginning of this section for encoding data and limits.

Operation

```
IF OperandSize = 16 (* CWD instruction *)
    THEN
        DX := SignExtend(AX);
    ELSE IF OperandSize = 32 (* CDQ instruction *)
        EDX := SignExtend(EAX); FI;
    ELSE IF 64-Bit Mode and OperandSize = 64 (* CQO instruction*)
        RDX := SignExtend(RAX); FI;
FI;
```

Flags Affected

None.

Exceptions (All Operating Modes)

#UD If the LOCK prefix is used.

DAA—Decimal Adjust AL After Addition

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------|-------------|-----------------|-----------------------------------|
| 27 | DAA | Z0 | Invalid | Valid | Decimal adjust AL after addition. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Adjusts the sum of two packed BCD values to create a packed BCD result. The AL register is the implied source and destination operand. The DAA instruction is only useful when it follows an ADD instruction that adds (binary addition) two 2-digit, packed BCD values and stores a byte result in the AL register. The DAA instruction then adjusts the contents of the AL register to contain the correct 2-digit, packed BCD result. If a decimal carry is detected, the CF and AF flags are set accordingly.

This instruction executes as described above in compatibility mode and legacy mode. It is not valid in 64-bit mode.

Operation

```
IF 64-Bit Mode
    THEN
        #UD;
    ELSE
        old_AL := AL;
        old_CF := CF;
        CF := 0;
        IF ((AL AND 0FH) > 9) or AF = 1
            THEN
                AL := AL + 6;
                CF := old_CF or (Carry from AL := AL + 6);
                AF := 1;
            ELSE
                AF := 0;
        FI;
        IF ((old_AL > 99H) or (old_CF = 1))
            THEN
                AL := AL + 60H;
                CF := 1;
            ELSE
                CF := 0;
        FI;
    FI;
```

Example

```
ADD    AL, BL    Before: AL=79H BL=35H EFLAGS(OSZAPC)=XXXXXX
                  After: AL=AEH BL=35H EFLAGS(OSZAPC)=110000
DAA     Before: AL=AEH BL=35H EFLAGS(OSZAPC)=110000
                  After: AL=14H BL=35H EFLAGS(OSZAPC)=X00111
DAA     Before: AL=2EH BL=35H EFLAGS(OSZAPC)=110000
                  After: AL=34H BL=35H EFLAGS(OSZAPC)=X00101
```

Flags Affected

The CF and AF flags are set if the adjustment of the value results in a decimal carry in either digit of the result (see the “Operation” section above). The SF, ZF, and PF flags are set according to the result. The OF flag is undefined.

Protected Mode Exceptions

#UD If the LOCK prefix is used.

Real-Address Mode Exceptions

#UD If the LOCK prefix is used.

Virtual-8086 Mode Exceptions

#UD If the LOCK prefix is used.

Compatibility Mode Exceptions

#UD If the LOCK prefix is used.

64-Bit Mode Exceptions

#UD If in 64-bit mode.

DAS—Decimal Adjust AL After Subtraction

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------|-------------|-----------------|--------------------------------------|
| 2F | DAS | Z0 | Invalid | Valid | Decimal adjust AL after subtraction. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Adjusts the result of the subtraction of two packed BCD values to create a packed BCD result. The AL register is the implied source and destination operand. The DAS instruction is only useful when it follows a SUB instruction that subtracts (binary subtraction) one 2-digit, packed BCD value from another and stores a byte result in the AL register. The DAS instruction then adjusts the contents of the AL register to contain the correct 2-digit, packed BCD result. If a decimal borrow is detected, the CF and AF flags are set accordingly.

This instruction executes as described above in compatibility mode and legacy mode. It is not valid in 64-bit mode.

Operation

```
IF 64-Bit Mode
  THEN
    #UD;
  ELSE
    old_AL := AL;
    old_CF := CF;
    CF := 0;
    IF (((AL AND 0FH) > 9) or AF = 1)
      THEN
        AL := AL - 6;
        CF := old_CF or (Borrow from AL := AL - 6);
        AF := 1;
      ELSE
        AF := 0;
    FI;
    IF ((old_AL > 99H) or (old_CF = 1))
      THEN
        AL := AL - 60H;
        CF := 1;
    FI;
  FI;
```

Example

```
SUB  AL, BL  Before: AL = 35H, BL = 47H, EFLAGS(OSZAPC) = XXXXXX
                After: AL = EEH, BL = 47H, EFLAGS(OSZAPC) = 010111
DAA                                Before: AL = EEH, BL = 47H, EFLAGS(OSZAPC) = 010111
                After: AL = 88H, BL = 47H, EFLAGS(OSZAPC) = X10111
```

Flags Affected

The CF and AF flags are set if the adjustment of the value results in a decimal borrow in either digit of the result (see the “Operation” section above). The SF, ZF, and PF flags are set according to the result. The OF flag is undefined.

Protected Mode Exceptions

#UD If the LOCK prefix is used.

Real-Address Mode Exceptions

#UD If the LOCK prefix is used.

Virtual-8086 Mode Exceptions

#UD If the LOCK prefix is used.

Compatibility Mode Exceptions

#UD If the LOCK prefix is used.

64-Bit Mode Exceptions

#UD If in 64-bit mode.

DEC—Decrement by 1

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|---------------|-----------------------|-------|-------------|-----------------|------------------------------|
| FE /1 | DEC r/m8 ¹ | M | Valid | Valid | Decrement <i>r/m8</i> by 1. |
| FF /1 | DEC r/m16 | M | Valid | Valid | Decrement <i>r/m16</i> by 1. |
| FF /1 | DEC r/m32 | M | Valid | Valid | Decrement <i>r/m32</i> by 1. |
| REX.W + FF /1 | DEC r/m64 | M | Valid | N.E. | Decrement <i>r/m64</i> by 1. |
| 48+rw | DEC r16 | O | N.E. | Valid | Decrement <i>r16</i> by 1. |
| 48+rd | DEC r32 | O | N.E. | Valid | Decrement <i>r32</i> by 1. |

NOTES:

1. With a REX prefix in 64-bit mode, attempts to access AH, BH, CH, or DH will instead access SPL, DIL, BPL, or SIL, respectively.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|--------------------|-----------|-----------|-----------|
| M | ModRM:r/m (r, w) | N/A | N/A | N/A |
| O | opcode + rd (r, w) | N/A | N/A | N/A |

Description

Subtracts 1 from the destination operand, while preserving the state of the CF flag. The destination operand can be a register or a memory location. This instruction allows a loop counter to be updated without disturbing the CF flag. (To perform a decrement operation that updates the CF flag, use a SUB instruction with an immediate operand of 1.)

This instruction can be used with a LOCK prefix to allow the instruction to be executed atomically.

In 64-bit mode, DEC r16 and DEC r32 are not encodable (because opcodes 48H through 4FH are REX prefixes). Otherwise, the instruction's 64-bit mode default operation size is 32 bits. Use of the REX.R prefix permits access to additional registers (R8-R15). Use of the REX.W prefix promotes operation to 64 bits.

See the summary chart at the beginning of this section for encoding data and limits.

Operation

DEST := DEST - 1;

Flags Affected

The CF flag is not affected. The OF, SF, ZF, AF, and PF flags are set according to the result.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If the destination operand is located in a non-writable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
|-----|---|

| | |
|-----|---|
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

DIV—Unsigned Divide

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|---------------|-----------------------|-------|-------------|-----------------|--|
| F6 /6 | DIV r/m8 ¹ | M | Valid | Valid | Unsigned divide AX by r/m8, with result stored in AL := Quotient, AH := Remainder. |
| F7 /6 | DIV r/m16 | M | Valid | Valid | Unsigned divide DX:AX by r/m16, with result stored in AX := Quotient, DX := Remainder. |
| F7 /6 | DIV r/m32 | M | Valid | Valid | Unsigned divide EDX:EAX by r/m32, with result stored in EAX := Quotient, EDX := Remainder. |
| REX.W + F7 /6 | DIV r/m64 | M | Valid | N.E. | Unsigned divide RDX:RAX by r/m64, with result stored in RAX := Quotient, RDX := Remainder. |

NOTES:

1. With a REX prefix in 64-bit mode, attempts to access AH, BH, CH, or DH will instead access SPL, DIL, BPL, or SIL, respectively.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|-----------|-----------|-----------|
| M | ModRM:r/m (w) | N/A | N/A | N/A |

Description

Divides unsigned the value in the AX, DX:AX, EDX:EAX, or RDX:RAX registers (dividend) by the source operand (divisor) and stores the result in the AX (AH:AL), DX:AX, EDX:EAX, or RDX:RAX registers. The source operand can be a general-purpose register or a memory location. The action of this instruction depends on the operand size (dividend/divisor). Division using 64-bit operand is available only in 64-bit mode.

Non-integral results are truncated (chopped) towards 0. The remainder is always less than the divisor in magnitude. Overflow is indicated with the #DE (divide error) exception rather than with the CF flag.

In 64-bit mode, the instruction's default operation size is 32 bits. Use of the REX.R prefix permits access to additional registers (R8-R15). Use of the REX.W prefix promotes operation to 64 bits. In 64-bit mode when REX.W is applied, the instruction divides the unsigned value in RDX:RAX by the source operand and stores the quotient in RAX, the remainder in RDX.

See the summary chart at the beginning of this section for encoding data and limits. See Table 3-24.

Table 3-24. DIV Action

| Operand Size | Dividend | Divisor | Quotient | Remainder | Maximum Quotient |
|----------------|----------|---------|----------|-----------|------------------|
| Word/byte | AX | r/m8 | AL | AH | 255 |
| Dword/word | DX:AX | r/m16 | AX | DX | 65,535 |
| Quadword/dword | EDX:EAX | r/m32 | EAX | EDX | $2^{32} - 1$ |
| Dword/quadword | RDX:RAX | r/m64 | RAX | RDX | $2^{64} - 1$ |

Operation

| C | Full | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | N/A |

Description

Performs a SIMD divide of the double precision floating-point values in the first source operand by the floating-point values in the second source operand (the third operand). Results are written to the destination operand (the first operand).

EVEX encoded versions: The first source operand (the second operand) is a ZMM/YMM/XMM register. The second source operand can be a ZMM/YMM/XMM register, a 512/256/128-bit memory location or a 512/256/128-bit vector broadcasted from a 64-bit memory location. The destination operand is a ZMM/YMM/XMM register conditionally updated with writemask k1.

VEX.256 encoded version: The first source operand (the second operand) is a YMM register. The second source operand can be a YMM register or a 256-bit memory location. The destination operand is a YMM register. The upper bits (MAXVL-1:256) of the corresponding destination are zeroed.

VEX.128 encoded version: The first source operand (the second operand) is a XMM register. The second source operand can be a XMM register or a 128-bit memory location. The destination operand is a XMM register. The upper bits (MAXVL-1:128) of the corresponding destination are zeroed.

128-bit Legacy SSE version: The second source operand (the second operand) can be an XMM register or an 128-bit memory location. The destination is the same as the first source operand. The upper bits (MAXVL-1:128) of the corresponding destination are unmodified.

| C | Full | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | N/A |

Description

Performs a SIMD divide of the four, eight or sixteen packed single precision floating-point values in the first source operand (the second operand) by the four, eight or sixteen packed single precision floating-point values in the second source operand (the third operand). Results are written to the destination operand (the first operand).

EVEX encoded versions: The first source operand (the second operand) is a ZMM/YMM/XMM register. The second source operand can be a ZMM/YMM/XMM register, a 512/256/128-bit memory location or a 512/256/128-bit vector broadcasted from a 32-bit memory location. The destination operand is a ZMM/YMM/XMM register conditionally updated with writemask k1.

VEX.256 encoded version: The first source operand is a YMM register. The second source operand can be a YMM register or a 256-bit memory location. The destination operand is a YMM register.

VEX.128 encoded version: The first source operand is a XMM register. The second source operand can be a XMM register or a 128-bit memory location. The destination operand is a XMM register. The upper bits (MAXVL-1:128) of the corresponding ZMM register destination are zeroed.

128-bit Legacy SSE version: The second source can be an XMM register or an 128-bit memory location. The destination is not distinct from the first source XMM register and the upper bits (MAXVL-1:128) of the corresponding ZMM register destination are unmodified.

|--|------------|------------------------------|-----------------------|--|
| F2 0F 5E /r DIVSD xmm1, xmm2/m64 | A | V/V | SSE2 | Divide low double precision floating-point value in xmm1 by low double precision floating-point value in xmm2/m64. |
| VEX.LIG.F2.0F.WIG 5E /r VDIVSD xmm1, xmm2, xmm3/m64 | B | V/V | AVX | Divide low double precision floating-point value in xmm2 by low double precision floating-point value in xmm3/m64. |
| EVEX.LLIG.F2.0F.W1 5E /r VDIVSD xmm1 {k1}{z}, xmm2, xmm3/m64{er} | C | V/V | AVX512F OR AVX10.1 | Divide low double precision floating-point value in xmm2 by low double precision floating-point value in xmm3/m64. |

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|------------------|---------------|---------------|-----------|
| A | N/A | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |
| B | N/A | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | N/A |
| C | Tuple1 Scalar | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | N/A |

Description

Divides the low double precision floating-point value in the first source operand by the low double precision floating-point value in the second source operand, and stores the double precision floating-point result in the destination operand. The second source operand can be an XMM register or a 64-bit memory location. The first source and destination are XMM registers.

128-bit Legacy SSE version: The first source operand and the destination operand are the same. Bits (MAXVL-1:64) of the corresponding ZMM destination register remain unchanged.

VEX.128 encoded version: The first source operand is an xmm register encoded by VEX.vvvv. The quadword at bits 127:64 of the destination operand is copied from the corresponding quadword of the first source operand. Bits (MAXVL-1:128) of the destination register are zeroed.

EVEX.128 encoded version: The first source operand is an xmm register encoded by EVEX.vvvv. The quadword element of the destination operand at bits 127:64 are copied from the first source operand. Bits (MAXVL-1:128) of the destination register are zeroed.

EVEX version: The low quadword element of the destination is updated according to the writemask.

Software should ensure VDIVSD is encoded with VEX.L=0. Encoding VDIVSD with VEX.L=1 may encounter unpredictable behavior across different processor generations.

Operation

VDIVSD (EVEX Encoded Version)

| C | Tuple1 Scalar | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | N/A |

Description

Divides the low single precision floating-point value in the first source operand by the low single precision floating-point value in the second source operand, and stores the single precision floating-point result in the destination operand. The second source operand can be an XMM register or a 32-bit memory location.

128-bit Legacy SSE version: The first source operand and the destination operand are the same. Bits (MAXVL-1:32) of the corresponding YMM destination register remain unchanged.

VEX.128 encoded version: The first source operand is an xmm register encoded by VEX.vvvv. The three high-order doublewords of the destination operand are copied from the first source operand. Bits (MAXVL-1:128) of the destination register are zeroed.

EVEX.128 encoded version: The first source operand is an xmm register encoded by EVEX.vvvv. The doubleword elements of the destination operand at bits 127:32 are copied from the first source operand. Bits (MAXVL-1:128) of the destination register are zeroed.

EVEX version: The low doubleword element of the destination is updated according to the writemask.

Software should ensure VDIVSS is encoded with VEX.L=0. Encoding VDIVSS with VEX.L=1 may encounter unpredictable behavior across different processor generations.

Operation

VDIVSS (EVEX Encoded Version)

```
IF (EVEX.b = 1) AND SRC2 *is a register*
    THEN
        SET_ROUNDING_MODE_FOR_THIS_INSTRUCTION(EVEX.RC);
    ELSE
        SET_ROUNDING_MODE_FOR_THIS_INSTRUCTION(MXCSR.RC);
FI;
IF k1[0] or *no writemask*
    THEN DEST[31:0] := SRC1[31:0] / SRC2[31:0]
    ELSE
        IF *merging-masking* ; merging-masking
            THEN *DEST[31:0] remains unchanged*
            ELSE ; zeroing-masking
                THEN DEST[31:0] := 0
        FI;
FI;
DEST[127:32] := SRC1[127:32]
DEST[MAXVL-1:128] := 0
```

VDIVSS (VEX.128 Encoded Version)

```
DEST[31:0] := SRC1[31:0] / SRC2[31:0]
DEST[127:32] := SRC1[127:32]
DEST[MAXVL-1:128] := 0
```

DIVSS (128-bit Legacy SSE Version)

```
DEST[31:0] := DEST[31:0] / SRC[31:0]
DEST[MAXVL-1:32] (Unmodified)
```

Intel C/C++ Compiler Intrinsic Equivalent

```
VDIVSS __m128 __mm_mask_div_ss(__m128 s, __mmask8 k, __m128 a, __m128 b);
VDIVSS __m128 __mm_maskz_div_ss(__mmask8 k, __m128 a, __m128 b);

VDIVSS __m128 __mm_maskz_div_round_ss(__mmask8 k, __m128 a, __m128 b, int);
DIVSS __m128 __mm_div_ss(__m128 a, __m128 b);
```

SIMD Floating-Point Exceptions

Overflow, Underflow, Invalid, Divide-by-Zero, Precision, Denormal.

Other Exceptions

VEX-encoded instructions, see Table 2-20, “Type 3 Class Exception Conditions.”

EVEX-encoded instructions, see Table 2-49, “Type E3 Class Exception Conditions.”

DPPD—Dot Product of Packed Double Precision Floating-Point Values

| Opcode/ Instruction | Op/ En | 64/32-bit Mode | CPUID Feature Flag | Description |
|---|-----------|-------------------|--------------------------|---|
| 66 0F 3A 41 /r ib DPPD xmm1, xmm2/m128, imm8 | RMI | V/V | SSE4_1 | Selectively multiply packed double precision floating-point values from xmm1 with packed double precision floating-point values from xmm2, add and selectively store the packed double precision floating-point values to xmm1. |
| VEX.128.66.0F3A.WIG 41 /r ib VDPPD xmm1, xmm2, xmm3/m128, imm8 | RVMI | V/V | AVX | Selectively multiply packed double precision floating-point values from xmm2 with packed double precision floating-point values from xmm3, add and selectively store the packed double precision floating-point values to xmm1. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------------|---------------|---------------|-----------|
| RMI | ModRM:reg (r, w) | ModRM:r/m (r) | imm8 | N/A |
| RVMI | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | imm8 |

Description

Conditionally multiplies the packed double precision floating-point values in the destination operand (first operand) with the packed double precision floating-point values in the source (second operand) depending on a mask extracted from bits [5:4] of the immediate operand (third operand). If a condition mask bit is zero, the corresponding multiplication is replaced by a value of 0.0 in the manner described by Section 12.8.4 of Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1.

The two resulting double precision values are summed into an intermediate result. The intermediate result is conditionally broadcasted to the destination using a broadcast mask specified by bits [1:0] of the immediate byte.

If a broadcast mask bit is “1”, the intermediate result is copied to the corresponding qword element in the destination operand. If a broadcast mask bit is zero, the corresponding element in the destination is set to zero.

DPPD follows the NaN forwarding rules stated in the Software Developer’s Manual, vol. 1, table 4.7. These rules do not cover horizontal prioritization of NaNs. Horizontal propagation of NaNs to the destination and the positioning of those NaNs in the destination is implementation dependent. NaNs on the input sources or computationally generated NaNs will have at least one NaN propagated to the destination.

128-bit Legacy SSE version: The second source can be an XMM register or an 128-bit memory location. The destination is not distinct from the first source XMM register and the upper bits (MAXVL-1:128) of the corresponding YMM register destination are unmodified.

VEX.128 encoded version: the first source operand is an XMM register or 128-bit memory location. The destination operand is an XMM register. The upper bits (MAXVL-1:128) of the corresponding YMM register destination are zeroed.

If VDPPD is encoded with VEX.L= 1, an attempt to execute the instruction encoded with VEX.L= 1 will cause an #UD exception.

Operation

DP_primitive (SRC1, SRC2)

```
IF (imm8[4] = 1)
    THEN Temp1[63:0] := DEST[63:0] * SRC[63:0]; // update SIMD exception flags
    ELSE Temp1[63:0] := +0.0; FI;
IF (imm8[5] = 1)
    THEN Temp1[127:64] := DEST[127:64] * SRC[127:64]; // update SIMD exception flags
    ELSE Temp1[127:64] := +0.0; FI;
/* if unmasked exception reported, execute exception handler*/
```

```
Temp2[63:0] := Temp1[63:0] + Temp1[127:64]; // update SIMD exception flags
/* if unmasked exception reported, execute exception handler*/
```

```
IF (imm8[0] = 1)
    THEN DEST[63:0] := Temp2[63:0];
    ELSE DEST[63:0] := +0.0; FI;
IF (imm8[1] = 1)
    THEN DEST[127:64] := Temp2[63:0];
    ELSE DEST[127:64] := +0.0; FI;
```

DPPD (128-bit Legacy SSE Version)

```
DEST[127:0] := DP_Primitive(SRC1[127:0], SRC2[127:0]);
DEST[MAXVL-1:128] (Unmodified)
```

VDPPD (VEX.128 Encoded Version)

```
DEST[127:0] := DP_Primitive(SRC1[127:0], SRC2[127:0]);
DEST[MAXVL-1:128] := 0
```

Flags Affected

None.

Intel C/C++ Compiler Intrinsic Equivalent

```
DPPD __m128d __mm_dp_pd ( __m128d a, __m128d b, const int mask);
```

SIMD Floating-Point Exceptions

Overflow, Underflow, Invalid, Precision, Denormal.

Exceptions are determined separately for each add and multiply operation. Unmasked exceptions will leave the destination untouched.

Other Exceptions

See Table 2-19, "Type 2 Class Exception Conditions," additionally:

#UD If VEX.L= 1.

DPPS—Dot Product of Packed Single Precision Floating-Point Values

| Opcode/ Instruction | Op/ En | 64/32-bit Mode | CPUID Feature Flag | Description |
|---|-----------|-------------------|--------------------------|--|
| 66 0F 3A 40 /r ib DPPS xmm1, xmm2/m128, imm8 | RMI | V/V | SSE4_1 | Selectively multiply packed single precision floating-point values from xmm1 with packed single precision floating-point values from xmm2, add and selectively store the packed single precision floating-point values or zero values to xmm1. |

| VEX.256.66.0F3A.WIG 40 /r ib VDPPS ymm1, ymm2, ymm3/m256, imm8 | RVMI | V/V | AVX | Multiply packed single precision floating-point values from ymm2 with packed single precision floating-point values from ymm3/mem, selectively add pairs of elements and store to ymm1. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------------|---------------|---------------|-----------|
| RMI | ModRM:reg (r, w) | ModRM:r/m (r) | imm8 | N/A |
| RVMI | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | imm8 |

Description

Conditionally multiplies the packed single precision floating-point values in the destination operand (first operand) with the packed single precision floats in the source (second operand) depending on a mask extracted from the high 4 bits of the immediate byte (third operand). If a condition mask bit in imm8[7:4] is zero, the corresponding multiplication is replaced by a value of 0.0 in the manner described by Section 12.8.4 of Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1.

The four resulting single precision values are summed into an intermediate result. The intermediate result is conditionally broadcasted to the destination using a broadcast mask specified by bits [3:0] of the immediate byte.

If a broadcast mask bit is “1”, the intermediate result is copied to the corresponding dword element in the destination operand. If a broadcast mask bit is zero, the corresponding element in the destination is set to zero.

DPPS follows the NaN forwarding rules stated in the Software Developer’s Manual, vol. 1, table 4.7. These rules do not cover horizontal prioritization of NaNs. Horizontal propagation of NaNs to the destination and the positioning of those NaNs in the destination is implementation dependent. NaNs on the input sources or computationally generated NaNs will have at least one NaN propagated to the destination.

128-bit Legacy SSE version: The second source can be an XMM register or an 128-bit memory location. The destination is not distinct from the first source XMM register and the upper bits (MAXVL-1:128) of the corresponding YMM register destination are unmodified.

VEX.128 encoded version: the first source operand is an XMM register or 128-bit memory location. The destination operand is an XMM register. The upper bits (MAXVL-1:128) of the corresponding YMM register destination are zeroed.

VEX.256 encoded version: The first source operand is a YMM register. The second source operand can be a YMM register or a 256-bit memory location. The destination operand is a YMM register.

Operation

DP_primitive (SRC1, SRC2)

SIMD Floating-Point Exceptions

Overflow, Underflow, Invalid, Precision, Denormal.

Exceptions are determined separately for each add and multiply operation, in the order of their execution.
Unmasked exceptions will leave the destination operands unchanged.

Other Exceptions

See Table 2-19, “Type 2 Class Exception Conditions.”

EMMS—Empty MMX Technology State

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|----------|-------------|-------|-------------|-----------------|------------------------------------|
| NP OF 77 | EMMS | Z0 | Valid | Valid | Set the x87 FPU tag word to empty. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Sets the values of all the tags in the x87 FPU tag word to empty (all 1s). This operation marks the x87 FPU data registers (which are aliased to the MMX technology registers) as available for use by x87 FPU floating-point instructions. (See Figure 8-7 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, for the format of the x87 FPU tag word.) All other MMX instructions (other than the EMMS instruction) set all the tags in x87 FPU tag word to valid (all 0s).

The EMMS instruction must be used to clear the MMX technology state at the end of all MMX technology procedures or subroutines and before calling other procedures or subroutines that may execute x87 floating-point instructions. If a floating-point instruction loads one of the registers in the x87 FPU data register stack before the x87 FPU tag word has been reset by the EMMS instruction, an x87 floating-point register stack overflow can occur that will result in an x87 floating-point exception or incorrect result.

EMMS operation is the same in non-64-bit modes and 64-bit mode.

Operation

x87FPUtagWord := FFFFH;

Intel C/C++ Compiler Intrinsic Equivalent

ENCODEKEY128—Encode 128-Bit Key With Key Locker

| Opcode/ Instruction | Op/ En | 64/32-bit Mode | CPUID Feature Flag | Description |
|--|-----------|-------------------|--------------------------|---|
| F3 0F 38 FA 11:rrr:bbb ENCODEKEY128 r32, r32, <XMM0-2>, <XMM4-6> | A | V/V | AESKLE | Wrap a 128-bit AES key from XMM0 into a key handle and output handle in XMM0—2. |

Instruction Operand Encoding

| Op/En | Tuple | Operand 1 | Operand 2 | Operand 3 | Operands 4—5 | Operands 6—7 |
|-------|-------|---------------|---------------|----------------------|---------------------|---------------------|
| A | N/A | ModRM:reg (w) | ModRM:r/m (r) | Implicit XMM0 (r, w) | Implicit XMM1—2 (w) | Implicit XMM4—6 (w) |

Description

The ENCODEKEY128¹ instruction wraps a 128-bit AES key from the implicit operand XMM0 into a key handle that is then stored in the implicit destination operands XMM0-2.

The explicit source operand specifies handle restrictions, if any.

The explicit destination operand is populated with information on the source of the key and its attributes. XMM4 through XMM6 are reserved for future usages and software should not rely upon them being zeroed.

Operation

ENCODEKEY128

#GP (0) if a reserved bit² in SRC[31:0] is set

InputKey[127:0] := XMM0;

KeyMetadata[2:0] = SRC[2:0];

KeyMetadata[23:3] = 0; // Reserved for future usage

KeyMetadata[27:24] = 0; // KeyType is AES-128 (value of 0)

KeyMetadata[127:28] = 0; // Reserved for future usage

// KeyMetadata is the AAD input and InputKey is the Plaintext input for WrapKey128

Handle[383:0] := WrapKey128(InputKey[127:0], KeyMetadata[127:0], lWKey.Integrity Key[127:0], lWKey.Encryption Key[255:0]);

DEST[0] := lWKey.NoBackup;

DEST[4:1] := lWKey.KeySource[3:0];

DEST[31:5] = 0;

XMM0 := Handle[127:0]; // AAD

XMM1 := Handle[255:128]; // Integrity Tag

XMM2 := Handle[383:256]; // CipherText

XMM4 := 0; // Reserved for future usage

XMM5 := 0; // Reserved for future usage

XMM6 := 0; // Reserved for future usage

RFLAGS.OF, SF, ZF, AF, PF, CF := 0;

Flags Affected

All arithmetic flags (OF, SF, ZF, AF, PF, CF) are cleared to 0. Although they are cleared for the currently defined operations, future extensions may report information in the flags.

1. Further details on Key Locker and usage of this instruction can be found here:
<https://software.intel.com/content/www/us/en/develop/download/intel-key-locker-specification.html>.
2. SRC[31:3] are currently reserved for future usages. SRC[2], which indicates a no-decrypt restriction, is reserved if CPUID.19H:EAX[2] is 0. SRC[1], which indicates a no-encrypt restriction, is reserved if CPUID.19H:EAX[1] is 0. SRC[0], which indicates a CPL0-only restriction, is reserved if CPUID.19H:EAX[0] is 0.

ENCODEKEY256—Encode 256-Bit Key With Key Locker

| Opcode/ Instruction | Op/ En | 64/32-bit Mode | CPUID Feature Flag | Description |
|--|-----------|-------------------|--------------------------|---|
| F3 0F 38 FB 11:rrr:bbb ENCODEKEY256 r32, r32 <XMM0-6> | A | V/V | AESKLE | Wrap a 256-bit AES key from XMM1:XMM0 into a key handle and store it in XMM0—3. |

Instruction Operand Encoding

| Op/En | Tuple | Operand 1 | Operand 2 | Operands 3—4 | Operands 5—9 |
|-------|-------|---------------|---------------|------------------------|---------------------|
| A | N/A | ModRM:reg (w) | ModRM:r/m (r) | Implicit XMM0—1 (r, w) | Implicit XMM2—6 (w) |

Description

The ENCODEKEY256¹ instruction wraps a 256-bit AES key from the implicit operand XMM1:XMM0 into a key handle that is then stored in the implicit destination operands XMM0-3.

The explicit source operand is a general-purpose register and specifies what handle restrictions should be built into the handle.

The explicit destination operand is populated with information on the source of the key and its attributes. XMM4 through XMM6 are reserved for future usages and software should not rely upon them being zeroed.

Operation

ENCODEKEY256

#GP (0) if a reserved bit² in SRC[31:0] is set

InputKey[255:0] := XMM1:XMM0;

KeyMetadata[2:0] = SRC[2:0];

KeyMetadata[23:3] = 0; // Reserved for future usage

KeyMetadata[27:24] = 1; // KeyType is AES-256 (value of 1)

KeyMetadata[127:28] = 0; // Reserved for future usage

// KeyMetadata is the AAD input and InputKey is the Plaintext input for WrapKey256

ENQCMD—Enqueue Command

| Opcode/ Instruction | Op/ En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|---|-----------|------------------------------|-----------------------|---|
| F2 0F 38 F8 ! (11); rrr:bbb ENQCMD r32/r64, m512 | A | V/V | ENQCMD | Atomically enqueue 64-byte user command from source memory operand to destination offset in ES segment specified in register operand as offset in ES segment. |

Instruction Operand Encoding

| Op/En | Tuple | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-------|---------------|---------------|-----------|-----------|
| A | N/A | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

The ENQCMD instruction allows software to write commands to **enqueue registers**, which are special device registers accessed using memory-mapped I/O (MMIO).
Enqueue registers expect writes to have the following format:

Figure 3-16. 64-Byte Data Written to Enqueue Registers

Bits 19:0 convey the process address space identifier (PASID), a value which system software may assign to individual software threads. Bit 31 contains privilege identification (0 = user; 1 = supervisor). Devices implementing enqueue registers may use these two values along with a device-specific command in the upper 60 bytes.

The ENQCMD instruction begins by reading 64 bytes of command data from its source memory operand. This is an ordinary load with cacheability and memory ordering implied normally by the memory type. The source operand need not be aligned, and there is no guarantee that all 64 bytes are loaded atomically. Bits 31:0 of the source operand must be zero.

The instruction then formats those 64 bytes into **command data** with a format consistent with that given in Figure 3-16:

- Command[19:0] get IA32_PASID[19:0].¹
- Command[30:20] are zero.
- Command[31] is 0 (indicating user; this value is used regardless of CPL).
- Command[511:32] get bits 511:32 of the source operand that was read from memory.

The ENQCMD instruction uses an **enqueue store** (defined below) to write this command data to the destination operand. The address of the destination operand is specified in a general-purpose register as an offset into the ES segment (the segment cannot be overridden).² The destination linear address must be 64-byte aligned. The operation of an enqueue store disregards the memory type of the destination memory address.

1. It is expected that system software will load the IA32_PASID MSR so that bits 19:0 contain the PASID of the current software thread. The MSR's valid bit, IA32_PASID[31], must be 1. For additional details on the IA32_PASID MSR, see the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4.

2. In 64-bit mode, the width of the register operand is 64 bits (32 bits with a 67H prefix). Outside 64-bit mode when CS.D = 1, the width is 32 bits (16 bits with a 67H prefix). Outside 64-bit mode when CS.D=0, the width is 16 bits (32 bits with a 67H prefix).

An enqueue store is not ordered relative to older stores to WB or WC memory (including non-temporal stores) or to executions of the CLFLUSHOPT or CLWB (when applied to addresses other than that of the enqueue store). Software can enforce such ordering by executing a fencing instruction such as SFENCE or MFENCE before the enqueue store.

An enqueue store does not write the data into the cache hierarchy, nor does it fetch any data into the cache hierarchy. An enqueue store's command data is never combined with that of any other store to the same address.

Unlike other stores, an enqueue store returns a status, which the ENQCMD instruction loads into the ZF flag in the RFLAGS register:

- ZF = 0 (success) reports that the 64-byte command data was written atomically to a device's enqueue register and has been accepted by the device. (It does not guarantee that the device has acted on the command; it may have queued it for later execution.)
- ZF = 1 (retry) reports that the command data was not accepted. This status is returned if the destination address is an enqueue register but the command was not accepted due to capacity or other temporal reasons. This status is also returned if the destination address was not an enqueue register (including the case of a memory address); in these cases, the store is dropped and is written neither to MMIO nor to memory.

Availability of the ENQCMD instruction is indicated by the presence of the CPUID feature flag ENQCMD (CPUID.(EAX=07H, ECX=0H):ECX[bit 29]).

Operation

```
IF IA32_PASID[31] = 0
    THEN #GP;
ELSE
    COMMAND := (SRC & ~FFFFFFFFH) | (IA32_PASID & FFFFFFFFH);
    DEST := COMMAND;
FI;
```

Intel C/C++ Compiler Intrinsic Equivalent

```
ENQCMD int_enqcmd(void *dst, const void *src)
```

Flags Affected

The ZF flag is set if the enqueue-store completion returns the retry status; otherwise it is cleared. All other flags are cleared.

ENQCMDS—Enqueue Command Supervisor

| Opcode/ Instruction | Op/ En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|--|-----------|------------------------------|-----------------------|---|
| F3 0F 38 F8 I(11);rrr:bbb ENQCMDS r32/r64, m512 | A | V/V | ENQCMD | Atomically enqueue 64-byte command with PASID from source memory operand to destination offset in ES segment specified in register operand as offset in ES segment. |

Instruction Operand Encoding

| Op/En | Tuple | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-------|---------------|---------------|-----------|-----------|
| A | N/A | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

The ENQCMDS instruction allows system software to write commands to **enqueue registers**, which are special device registers accessed using memory-mapped I/O (MMIO).

Enqueue registers expect writes to have the format given in Figure 3-16 and explained in the section on “ENQCMD—Enqueue Command.”

The ENQCMDS instruction begins by reading 64 bytes of command data from its source memory operand. This is an ordinary load with cacheability and memory ordering implied normally by the memory type. The source operand need not be aligned, and there is no guarantee that all 64 bytes are loaded atomically. Bits 30:20 of the source operand must be zero.

ENQCMDS formats its source data differently from ENQCMD. Specifically, it formats them into **command data** as follows:

- Command[19:0] get bits 19:0 of the source operand that was read from memory. These 20 bits communicate a process address-space identifier (PASID).
- Command[30:20] are zero.
- Command[511:31] get bits 511:31 of the source operand that was read from memory. Bit 31 communicates a privilege identification (0 = user; 1 = supervisor).

The ENQCMDS instruction then uses an **enqueue store** (defined below) to write this command data to the destination operand. The address of the destination operand is specified in a general-purpose register as an offset into the ES segment (the segment cannot be overridden).¹ The destination linear address must be 64-byte aligned. The operation of an enqueue store disregards the memory type of the destination memory address.

An enqueue store is not ordered relative to older stores to WB or WC memory (including non-temporal stores) or to executions of the CLFLUSHOPT or CLWB (when applied to addresses other than that of the enqueue store). Software can enforce such ordering by executing a fencing instruction such as SFENCE or MFENCE before the enqueue store.

An enqueue store does not write the data into the cache hierarchy, nor does it fetch any data into the cache hierarchy. An enqueue store’s command data is never combined with that of any other store to the same address.

Unlike other stores, an enqueue store returns a status, which the ENQCMDS instruction loads into the ZF flag in the RFLAGS register:

- ZF = 0 (success) reports that the 64-byte command data was written atomically to a device’s enqueue register and has been accepted by the device. (It does not guarantee that the device has acted on the command; it may have queued it for later execution.)
- ZF = 1 (retry) reports that the command data was not accepted. This status is returned if the destination address is an enqueue register but the command was not accepted due to capacity or other temporal reasons.

1. In 64-bit mode, the width of the register operand is 64 bits (32 bits with a 67H prefix). Outside 64-bit mode when CS.D = 1, the width is 32 bits (16 bits with a 67H prefix). Outside 64-bit mode when CS.D=0, the width is 16 bits (32 bits with a 67H prefix).

This status is also returned if the destination address was not an enqueue register (including the case of a memory address); in these cases, the store is dropped and is written neither to MMIO nor to memory.

The ENQCMDS instruction may be executed only if CPL = 0. Availability of the ENQCMDS instruction is indicated by the presence of the CPUID feature flag ENQCMD (CPUID.(EAX=07H, ECX=0H):ECX[bit 29]).

ENTER—Make Stack Frame for Procedure Parameters

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|----------|-------------------|-------|-------------|-----------------|---|
| C8 iw 00 | ENTER imm16, 0 | II | Valid | Valid | Create a stack frame for a procedure. |
| C8 iw 01 | ENTER imm16, 1 | II | Valid | Valid | Create a stack frame with a nested pointer for a procedure. |
| C8 iw ib | ENTER imm16, imm8 | II | Valid | Valid | Create a stack frame with nested pointers for a procedure. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| II | iw | imm8 | N/A | N/A |

Description

Creates a stack frame (comprising of space for dynamic storage and 1-32 frame pointer storage) for a procedure. The first operand (imm16) specifies the size of the dynamic storage in the stack frame (that is, the number of bytes of dynamically allocated on the stack for the procedure). The second operand (imm8) gives the lexical nesting level (0 to 31) of the procedure. The nesting level (imm8 mod 32) and the OperandSize attribute determine the size in bytes of the storage space for frame pointers.

The nesting level determines the number of frame pointers that are copied into the “display area” of the new stack frame from the preceding frame. The default size of the frame pointer is the StackAddrSize attribute, but can be overridden using the 66H prefix. Thus, the OperandSize attribute determines the size of each frame pointer that will be copied into the stack frame and the data being transferred from SP/ESP/RSP register into the BP/EBP/RBP register.

The ENTER and companion LEAVE instructions are provided to support block structured languages. The ENTER instruction (when used) is typically the first instruction in a procedure and is used to set up a new stack frame for a procedure. The LEAVE instruction is then used at the end of the procedure (just before the RET instruction) to release the stack frame.

If the nesting level is 0, the processor pushes the frame pointer from the BP/EBP/RBP register onto the stack, copies the current stack pointer from the SP/ESP/RSP register into the BP/EBP/RBP register, and loads the SP/ESP/RSP register with the current stack-pointer value minus the value in the size operand. For nesting levels of 1 or greater, the processor pushes additional frame pointers on the stack before adjusting the stack pointer. These additional frame pointers provide the called procedure with access points to other nested frames on the stack. See “Procedure Calls for Block-Structured Languages” in Chapter 6 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1, for more information about the actions of the ENTER instruction.

The ENTER instruction causes a page fault whenever a write using the final value of the stack pointer (within the current stack segment) would do so.

In 64-bit mode, default operation size is 64 bits; 32-bit operation size cannot be encoded. Use of 66H prefix changes frame pointer operand size to 16 bits.

When the 66H prefix is used and causing the OperandSize attribute to be less than the StackAddrSize, software is responsible for the following:

- The companion LEAVE instruction must also use the 66H prefix,
- The value in the RBP/EBP register prior to executing “66H ENTER” must be within the same 16KByte region of the current stack pointer (RSP/ESP), such that the value of RBP/EBP after “66H ENTER” remains a valid address in the stack. This ensures “66H LEAVE” can restore 16-bits of data from the stack.

Operation

```
AllocSize := imm16;

| 66 0F 3A 17 /r ib EXTRACTPS reg/m32, xmm1, imm8 | A | VV | SSE4_1 | Extract one single precision floating-point value from xmm1 at the offset specified by imm8 and store the result in reg or m32. Zero extend the results in 64-bit register if applicable. |
| VEX.128.66.0F3A.WIG 17 /r ib VEXTRACTPS reg/m32, xmm1, imm8 | A | V/V | AVX | Extract one single precision floating-point value from xmm1 at the offset specified by imm8 and store the result in reg or m32. Zero extend the results in 64-bit register if applicable. |
| EVEX.128.66.0F3A.WIG 17 /r ib VEXTRACTPS reg/m32, xmm1, imm8 | B | V/V | AVX512F OR AVX10.1 | Extract one single precision floating-point value from xmm1 at the offset specified by imm8 and store the result in reg or m32. Zero extend the results in 64-bit register if applicable. |

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|---------------|-----------|-----------|
| A | N/A | ModRM:r/m (w) | ModRM:reg (r) | imm8 | N/A |
| B | Tuple1 Scalar | ModRM:r/m (w) | ModRM:reg (r) | imm8 | N/A |

Description

Extracts a single precision floating-point value from the source operand (second operand) at the 32-bit offset specified from imm8. Immediate bits higher than the most significant offset for the vector length are ignored.

The extracted single precision floating-point value is stored in the low 32-bits of the destination operand

In 64-bit mode, destination register operand has default operand size of 64 bits. The upper 32-bits of the register are filled with zero. REX.W is ignored.

VEX.128 and EVEX encoded version: When VEX.W1 or EVEX.W1 form is used in 64-bit mode with a general purpose register (GPR) as a destination operand, the packed single quantity is zero extended to 64 bits.

VEX.vvvv/EVEX.vvvv is reserved and must be 1111b otherwise instructions will #UD.

128-bit Legacy SSE version: When a REX.W prefix is used in 64-bit mode with a general purpose register (GPR) as a destination operand, the packed single quantity is zero extended to 64 bits.

The source register is an XMM register. Imm8[1:0] determine the starting DWORD offset from which to extract the 32-bit floating-point value.

If VEXTRACTPS is encoded with VEX.L= 1, an attempt to execute the instruction encoded with VEX.L= 1 will cause an #UD exception.

F2XM1—Compute 2^x-1

| Opcode | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|--------|-------------|-------------|------------------|---|
| D9 F0 | F2XM1 | Valid | Valid | Replace ST(0) with $(2^{\text{ST}(0)} - 1)$. |

Description

Computes the exponential value of 2 to the power of the source operand minus 1. The source operand is located in register ST(0) and the result is also stored in ST(0). The value of the source operand must lie in the range -1.0 to $+1.0$. If the source value is outside this range, the result is undefined.

The following table shows the results obtained when computing the exponential value of various classes of numbers, assuming that neither overflow nor underflow occurs.

Table 3-25. Results Obtained from F2XM1

| ST(0) SRC | ST(0) DEST |
|----------------|----------------|
| -1.0 to -0 | -0.5 to -0 |
| -0 | -0 |
| $+0$ | $+0$ |
| $+0$ to $+1.0$ | $+0$ to 1.0 |

Values other than 2 can be exponentiated using the following formula:

$$x^y := 2^{(y * \log_2 x)}$$

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

$\text{ST}(0) := (2^{\text{ST}(0)} - 1);$

FPU Flags Affected

| | |
|------------|---|
| C1 | Set to 0 if stack underflow occurred. Set if result was rounded up; cleared otherwise. |
| C0, C2, C3 | Undefined. |

Floating-Point Exceptions

| | |
|-----|--|
| #IS | Stack underflow occurred. |
| #IA | Source operand is an SNaN value or unsupported format. |
| #D | Source is a denormal value. |
| #U | Result is too small for destination format. |
| #P | Value cannot be represented exactly in destination format. |

Protected Mode Exceptions

| | |

FABS—Absolute Value

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------------|-----------------|-------------------------------------|
| D9 E1 | FABS | Valid | Valid | Replace ST with its absolute value. |

Description

Clears the sign bit of ST(0) to create the absolute value of the operand. The following table shows the results obtained when creating the absolute value of various classes of numbers.

Table 3-26. Results Obtained from FABS

| ST(0) SRC | ST(0) DEST |
|-----------|------------|
| $-\infty$ | $+\infty$ |
| $-F$ | $+F$ |
| -0 | $+0$ |
| $+0$ | $+0$ |
| $+F$ | $+F$ |
| $+\infty$ | $+\infty$ |
| NaN | NaN |

NOTES:

F Means finite floating-point value.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

$ST(0) := |ST(0)|;$

FPU Flags Affected

C1 Set to 0.
C0, C2, C3 Undefined.

Floating-Point Exceptions

#IS Stack underflow occurred.

Protected Mode Exceptions

#NM CR0.EM[bit 2] or CR0.TS[bit 3] = 1.
#UD If the LOCK prefix is used.

FADD/FADDP/FIADD—Add

| Opcode | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|---------|--------------------|-------------|------------------|--|
| D8 /0 | FADD m32fp | Valid | Valid | Add m32fp to ST(0) and store result in ST(0). |
| DC /0 | FADD m64fp | Valid | Valid | Add m64fp to ST(0) and store result in ST(0). |
| D8 C0+i | FADD ST(0), ST(i) | Valid | Valid | Add ST(0) to ST(i) and store result in ST(0). |
| DC C0+i | FADD ST(i), ST(0) | Valid | Valid | Add ST(i) to ST(0) and store result in ST(i). |
| DE C0+i | FADDP ST(i), ST(0) | Valid | Valid | Add ST(0) to ST(i), store result in ST(i), and pop the register stack. |
| DE C1 | FADDP | Valid | Valid | Add ST(0) to ST(1), store result in ST(1), and pop the register stack. |
| DA /0 | FIADD m32int | Valid | Valid | Add m32int to ST(0) and store result in ST(0). |
| DE /0 | FIADD m16int | Valid | Valid | Add m16int to ST(0) and store result in ST(0). |

Description

Adds the destination and source operands and stores the sum in the destination location. The destination operand is always an FPU register; the source operand can be a register or a memory location. Source operands in memory can be in single precision or double precision floating-point format or in word or doubleword integer format.

The no-operand version of the instruction adds the contents of the ST(0) register to the ST(1) register. The one-operand version adds the contents of a memory location (either a floating-point or an integer value) to the contents of the ST(0) register. The two-operand version, adds the contents of the ST(0) register to the ST(i) register or vice versa. The value in ST(0) can be doubled by coding:

```
FADD ST(0), ST(0);
```

The FADDP instructions perform the additional operation of popping the FPU register stack after storing the result. To pop the register stack, the processor marks the ST(0) register as empty and increments the stack pointer (TOP) by 1. (The no-operand version of the floating-point add instructions always results in the register stack being popped. In some assemblers, the mnemonic for this instruction is FADD rather than FADDP.)

The FIADD instructions convert an integer source operand to double extended-precision floating-point format before performing the addition.

The table on the following page shows the results obtained when adding various classes of numbers, assuming that neither overflow nor underflow occurs.

When the sum of two operands with opposite signs is 0, the result is +0, except for the round toward $-\infty$ mode, in which case the result is -0 . When the source operand is an integer 0, it is treated as a +0.

When both operand are infinities of the same sign, the result is ∞ of the expected sign. If both operands are infinities of opposite signs, an invalid-operation exception is generated. See Table 3-27.

Table 3-27. FADD/FADDP/FIADD Results

| SRC | DEST | | | | | | | |
|-----|--------------|-----------|--------------------|-----------|-----------|--------------------|-----------|-----|
| | | $-\infty$ | $-F$ | -0 | $+0$ | $+F$ | $+\infty$ | NaN |
| | $-\infty$ | $-\infty$ | $-\infty$ | $-\infty$ | $-\infty$ | $-\infty$ | * | NaN |
| | $-F$ or $-I$ | $-\infty$ | $-F$ | SRC | SRC | $\pm F$ or ± 0 | $+\infty$ | NaN |
| | -0 | $-\infty$ | DEST | -0 | ± 0 | DEST | $+\infty$ | NaN |
| | $+0$ | $-\infty$ | DEST | ± 0 | $+0$ | DEST | $+\infty$ | NaN |
| | $+F$ or $+I$ | $-\infty$ | $\pm F$ or ± 0 | SRC | SRC | $+F$ | $+\infty$ | NaN |
| | $+\infty$ | * | $+\infty$ | $+\infty$ | $+\infty$ | $+\infty$ | $+\infty$ | NaN |
| | NaN | NaN | NaN | NaN | NaN | NaN | NaN | NaN |

NOTES:

F Means finite floating-point value.

I Means integer.

* Indicates floating-point invalid-arithmetic-operand (#IA) exception.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

IF Instruction = FIADD

THEN

Set if result was rounded up; cleared otherwise.

C0, C2, C3 Undefined.

Floating-Point Exceptions

#IS Stack underflow occurred.

#IA Operand is an SNaN value or unsupported format.
Operands are infinities of unlike sign.

#D Source operand is a denormal value.

#U Result is too small for destination format.

#O Result is too large for destination format.

#P Value cannot be represented exactly in destination format.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

FBLD—Load Binary Coded Decimal

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------------|-----------------|--|
| DF /4 | FBLD m80bcd | Valid | Valid | Convert BCD value to floating-point and push onto the FPU stack. |

Description

Converts the BCD source operand into double extended-precision floating-point format and pushes the value onto the FPU stack. The source operand is loaded without rounding errors. The sign of the source operand is preserved, including that of -0 .

The packed BCD digits are assumed to be in the range 0 through 9; the instruction does not check for invalid digits (AH through FH). Attempting to load an invalid encoding produces an undefined result.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

TOP := TOP – 1;

ST(0) := ConvertToDoubleExtendedPrecisionFP(SRC);

FPU Flags Affected

C1 Set to 1 if stack overflow occurred; otherwise, set to 0.
C0, C2, C3 Undefined.

Floating-Point Exceptions

#IS Stack overflow occurred.

Protected Mode Exceptions

#GP(0) If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.
 If the DS, ES, FS, or GS register contains a NULL segment selector.
#SS(0) If a memory operand effective address is outside the SS segment limit.
#NM CR0.EM[bit 2] or CR0.TS[bit 3] = 1.
#PF(fault-code) If a page fault occurs.
#AC(0) If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3.
#UD If the LOCK prefix is used.

Real-Address Mode Exceptions

#GP If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.
#SS If a memory operand effective address is outside the SS segment limit.
#NM CR0.EM[bit 2] or CR0.TS[bit 3] = 1.
#UD If the LOCK prefix is used.

Virtual-8086 Mode Exceptions

#GP(0) If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.
#SS(0) If a memory operand effective address is outside the SS segment limit.
#NM CR0.EM[bit 2] or CR0.TS[bit 3] = 1.
#PF(fault-code) If a page fault occurs.
#AC(0) If alignment checking is enabled and an unaligned memory reference is made.
#UD If the LOCK prefix is used.

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

FBSTP—Store BCD Integer and Pop

| Opcode | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|--------|--------------|-------------|------------------|--------------------------------------|
| DF /6 | FBSTP m80bcd | Valid | Valid | Store ST(0) in m80bcd and pop ST(0). |

Description

Converts the value in the ST(0) register to an 18-digit packed BCD integer, stores the result in the destination operand, and pops the register stack. If the source value is a non-integral value, it is rounded to an integer value, according to rounding mode specified by the RC field of the FPU control word. To pop the register stack, the processor marks the ST(0) register as empty and increments the stack pointer (TOP) by 1.

The destination operand specifies the address where the first byte destination value is to be stored. The BCD value (including its sign bit) requires 10 bytes of space in memory.

The following table shows the results obtained when storing various classes of numbers in packed BCD format.

Table 3-28. FBSTP Results

| ST(0) | DEST |
|--|------|
| $-\infty$ or Value Too Large for DEST Format | * |
| $F \leq -1$ | $-D$ |
| $-1 < F < -0$ | ** |
| -0 | -0 |
| $+0$ | $+0$ |
| $+0 < F < +1$ | ** |
| $F \geq +1$ | $+D$ |
| $+\infty$ or Value Too Large for DEST Format | * |
| NaN | * |

NOTES:

F Means finite floating-point value.

D Means packed-BCD number.

* Indicates floating-point invalid-operation (#IA) exception.

** ± 0 or ± 1 , depending on the rounding mode.

If the converted value is too large for the destination format, or if the source operand is an ∞ , SNaN, QNaN, or is in an unsupported format, an invalid-arithmetic-operand condition is signaled. If the invalid-operation exception is not masked, an invalid-arithmetic-operand exception (#IA) is generated and no value is stored in the destination operand. If the invalid-operation exception is masked, the packed BCD indefinite value is stored in memory.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

DEST := BCD(ST(0));

PopRegisterStack;

FPU Flags Affected

| | |
|------------|--|
| C1 | Set to 0 if stack underflow occurred. |
| | Set if result was rounded up; cleared otherwise. |
| C0, C2, C3 | Undefined. |

Floating-Point Exceptions

| | |
|-----|--|
| #IS | Stack underflow occurred. |
| #IA | Converted value that exceeds 18 BCD digits in length. Source operand is an SNaN, QNaN, $\pm\infty$, or in an unsupported format. |
| #P | Value cannot be represented exactly in destination format. |

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If a segment register is being loaded with a segment selector that points to a non-writable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

FCFS—Change Sign

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------------|-----------------|----------------------------|
| D9 E0 | FCFS | Valid | Valid | Complements sign of ST(0). |

Description

Complements the sign bit of ST(0). This operation changes a positive value into a negative value of equal magnitude or vice versa. The following table shows the results obtained when changing the sign of various classes of numbers.

Table 3-29. FCFS Results

| ST(0) SRC | ST(0) DEST |
|-----------|------------|
| $-\infty$ | $+\infty$ |
| $-F$ | $+F$ |
| -0 | $+0$ |
| $+0$ | -0 |
| $+F$ | $-F$ |
| $+\infty$ | $-\infty$ |
| NaN | NaN |

NOTES:

* F means finite floating-point value.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

$\text{SignBit}(\text{ST}(0)) := \text{NOT}(\text{SignBit}(\text{ST}(0)))$;

FPU Flags Affected

C1 Set to 0.
C0, C2, C3 Undefined.

Floating-Point Exceptions

#IS Stack underflow occurred.

Protected Mode Exceptions

#NM CR0.EM[bit 2] or CR0.TS[bit 3] = 1.
#UD If the LOCK prefix is used.

Real-Address Mode Exceptions

FCLEX/FNCLEX—Clear Exceptions

| Opcode ¹ | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|---------------------|---------------------|-------------|-----------------|---|
| 9B DB E2 | FCLEX | Valid | Valid | Clear floating-point exception flags after checking for pending unmasked floating-point exceptions. |
| DB E2 | FNCLEX ¹ | Valid | Valid | Clear floating-point exception flags without checking for pending unmasked floating-point exceptions. |

NOTES:

1. See IA-32 Architecture Compatibility section below.

Description

Clears the floating-point exception flags (PE, UE, OE, ZE, DE, and IE), the exception summary status flag (ES), the stack fault flag (SF), and the busy flag (B) in the FPU status word. The FCLEX instruction checks for and handles any pending unmasked floating-point exceptions before clearing the exception flags; the FNCLEX instruction does not.

The assembler issues two instructions for the FCLEX instruction (an FWAIT instruction followed by an FNCLEX instruction), and the processor executes each of these instructions separately. If an exception is generated for either of these instructions, the save EIP points to the instruction that caused the exception.

IA-32 Architecture Compatibility

When operating a Pentium or Intel486 processor in MS-DOS* compatibility mode, it is possible (under unusual circumstances) for an FNCLEX instruction to be interrupted prior to being executed to handle a pending FPU exception. See the section titled “No-Wait FPU Instructions Can Get FPU Interrupt in Window” in Appendix D of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1, for a description of these circumstances. An FNCLEX instruction cannot be interrupted in this way on later Intel processors, except for the Intel Quark™ X1000 processor.

This instruction affects only the x87 FPU floating-point exception flags. It does not affect the SIMD floating-point exception flags in the MXCSR register.

This instruction’s operation is the same in non-64-bit modes and 64-bit mode.

Operation

```
FPUStatusWord[0:7] := 0;  
FPUStatusWord[15] := 0;
```

FPU Flags Affected

The PE, UE, OE, ZE, DE, IE, ES, SF, and B flags in the FPU status word are cleared. The C0, C1, C2, and C3 flags are undefined.

Floating-Point Exceptions

None.

Protected Mode Exceptions

```
#NM          CR0.EM[bit 2] or CR0.TS[bit 3] = 1.  
#UD          If the LOCK prefix is used.
```

FCMOVcc—Floating-Point Conditional Move

| Opcode ¹ | Instruction | 64-Bit Mode | Compat/Leg Mode ¹ | Description |
|---------------------|-----------------------|-------------|------------------------------|---|
| DA C0+i | FCMOVB ST(0), ST(i) | Valid | Valid | Move if below (CF=1). |
| DA C8+i | FCMOVE ST(0), ST(i) | Valid | Valid | Move if equal (ZF=1). |
| DA D0+i | FCMOVBE ST(0), ST(i) | Valid | Valid | Move if below or equal (CF=1 or ZF=1). |
| DA D8+i | FCMOVU ST(0), ST(i) | Valid | Valid | Move if unordered (PF=1). |
| DB C0+i | FCMOVNB ST(0), ST(i) | Valid | Valid | Move if not below (CF=0). |
| DB C8+i | FCMOVNE ST(0), ST(i) | Valid | Valid | Move if not equal (ZF=0). |
| DB D0+i | FCMOVNBE ST(0), ST(i) | Valid | Valid | Move if not below or equal (CF=0 and ZF=0). |
| DB D8+i | FCMOVNU ST(0), ST(i) | Valid | Valid | Move if not unordered (PF=0). |

NOTES:

1. See IA-32 Architecture Compatibility section below.

Description

Tests the status flags in the EFLAGS register and moves the source operand (second operand) to the destination operand (first operand) if the given test condition is true. The condition for each mnemonic is given in the Description column above and in Chapter 8 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1. The source operand is always in the ST(i) register and the destination operand is always ST(0).

The FCMOVcc instructions are useful for optimizing small IF constructions. They also help eliminate branching overhead for IF operations and the possibility of branch mispredictions by the processor.

A processor may not support the FCMOVcc instructions. Software can check if the FCMOVcc instructions are supported by checking the processor's feature information with the CPUID instruction (see "COMISS—Compare Scalar Ordered Single Precision Floating-Point Values and Set EFLAGS" in this chapter). If both the CMOV and FPU feature bits are set, the FCMOVcc instructions are supported.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

IA-32 Architecture Compatibility

The FCMOVcc instructions were introduced to the IA-32 Architecture in the P6 family processors and are not available in earlier IA-32 processors.

Operation

IF condition TRUE
THEN ST(0) := ST(i);
FI;

FPU Flags Affected

FCOM/FCOMP/FCOMPP—Compare Floating-Point Values

| Opcode | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|---------|-------------|-------------|------------------|--|
| D8 /2 | FCOM m32fp | Valid | Valid | Compare ST(0) with m32fp. |
| DC /2 | FCOM m64fp | Valid | Valid | Compare ST(0) with m64fp. |
| D8 D0+i | FCOM ST(i) | Valid | Valid | Compare ST(0) with ST(i). |
| D8 D1 | FCOM | Valid | Valid | Compare ST(0) with ST(1). |
| D8 /3 | FCOMP m32fp | Valid | Valid | Compare ST(0) with m32fp and pop register stack. |
| DC /3 | FCOMP m64fp | Valid | Valid | Compare ST(0) with m64fp and pop register stack. |
| D8 D8+i | FCOMP ST(i) | Valid | Valid | Compare ST(0) with ST(i) and pop register stack. |
| D8 D9 | FCOMP | Valid | Valid | Compare ST(0) with ST(1) and pop register stack. |
| DE D9 | FCOMPP | Valid | Valid | Compare ST(0) with ST(1) and pop register stack twice. |

Description

Compares the contents of register ST(0) and source value and sets condition code flags C0, C2, and C3 in the FPU status word according to the results (see the table below). The source operand can be a data register or a memory location. If no source operand is given, the value in ST(0) is compared with the value in ST(1). The sign of zero is ignored, so that -0.0 is equal to $+0.0$.

Table 3-30. FCOM/FCOMP/FCOMPP Results

| Condition | C3 | C2 | C0 |
|-------------|----|----|----|
| ST(0) > SRC | 0 | 0 | 0 |
| ST(0) < SRC | 0 | 0 | 1 |
| ST(0) = SRC | 1 | 0 | 0 |
| Unordered* | 1 | 1 | 1 |

NOTES:

* Flags not set if unmasked invalid-arithmetic-operand (#IA) exception is generated.

This instruction checks the class of the numbers being compared (see “FXAM—Examine Floating-Point” in this chapter). If either operand is a NaN or is in an unsupported format, an invalid-arithmetic-operand exception (#IA) is raised and, if the exception is masked, the condition flags are set to “unordered.” If the invalid-arithmetic-operand exception is unmasked, the condition code flags are not set.

The FCOMP instruction pops the register stack following the comparison operation and the FCOMPP instruction pops the register stack twice following the comparison operation. To pop the register stack, the processor marks the ST(0) register as empty and increments the stack pointer (TOP) by 1.

The FCOM instructions perform the same operation as the FUCOM instructions. The only difference is how they handle QNaN operands. The FCOM instructions raise an invalid-arithmetic-operand exception (#IA) when either or both of the operands is a NaN value or is in an unsupported format. The FUCOM instructions perform the same operation as the FCOM instructions, except that they do not generate an invalid-arithmetic-operand exception for QNaNs.

This instruction’s operation is the same in non-64-bit modes and 64-bit mode.

Operation

#PF(fault-code) If a page fault occurs.

#AC(0) If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3.

#UD If the LOCK prefix is used.

Real-Address Mode Exceptions

#GP If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.

#SS If a memory operand effective address is outside the SS segment limit.

#NM CR0.EM[bit 2] or CR0.TS[bit 3] = 1.

#UD If the LOCK prefix is used.

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

FCOMI/FCOMIP/FUCOMI/FUCOMIP—Compare Floating-Point Values and Set EFLAGS

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|---------|-------------------|-------------|-----------------|---|
| DB F0+i | FCOMI ST, ST(i) | Valid | Valid | Compare ST(0) with ST(i) and set status flags accordingly. |
| DF F0+i | FCOMIP ST, ST(i) | Valid | Valid | Compare ST(0) with ST(i), set status flags accordingly, and pop register stack. |
| DB E8+i | FUCOMI ST, ST(i) | Valid | Valid | Compare ST(0) with ST(i), check for ordered values, and set status flags accordingly. |
| DF E8+i | FUCOMIP ST, ST(i) | Valid | Valid | Compare ST(0) with ST(i), check for ordered values, set status flags accordingly, and pop register stack. |

Description

Performs an unordered comparison of the contents of registers ST(0) and ST(i) and sets the status flags ZF, PF, and CF in the EFLAGS register according to the results (see the table below). The sign of zero is ignored for comparisons, so that -0.0 is equal to $+0.0$.

Table 3-31. FCOMI/FCOMIP/ FUCOMI/FUCOMIP Results

| Comparison Results* | ZF | PF | CF |
|---------------------|----|----|----|
| ST0 > ST(i) | 0 | 0 | 0 |
| ST0 < ST(i) | 0 | 0 | 1 |
| ST0 = ST(i) | 1 | 0 | 0 |
| Unordered** | 1 | 1 | 1 |

NOTES:

* See the IA-32 Architecture Compatibility section below.

** Flags not set if unmasked invalid-arithmetic-operand (#IA) exception is generated.

An unordered comparison checks the class of the numbers being compared (see “FXAM—Examine Floating-Point” in this chapter). The FUCOMI/FUCOMIP instructions perform the same operations as the FCOMI/FCOMIP instructions. The only difference is that the FUCOMI/FUCOMIP instructions raise the invalid-arithmetic-operand exception (#IA) only when either or both operands are an SNaN or are in an unsupported format; QNaNs cause the condition code flags to be set to unordered, but do not cause an exception to be generated. The FCOMI/FCOMIP instructions raise an invalid-operation exception when either or both of the operands are a NaN value of any kind or are in an unsupported format.

If the operation results in an invalid-arithmetic-operand exception being raised, the status flags in the EFLAGS register are set only if the exception is masked.

The FCOMI/FCOMIP and FUCOMI/FUCOMIP instructions set the OF, SF, and AF flags to zero in the EFLAGS register (regardless of whether an invalid-operation exception is detected).

The FCOMIP and FUCOMIP instructions also pop the register stack following the comparison operation. To pop the register stack, the processor marks the ST(0) register as empty and increments the stack pointer (TOP) by 1.

This instruction’s operation is the same in non-64-bit modes and 64-bit mode.

IA-32 Architecture Compatibility

The FCOMI/FCOMIP/FUCOMI/FUCOMIP instructions were introduced to the IA-32 Architecture in the P6 family processors and are not available in earlier IA-32 processors.

Operation

CASE (relation of operands) OF

ST(0) > ST(i): ZF, PF, CF := 000;

ST(0) < ST(i): ZF, PF, CF := 001;

ST(0) = ST(i): ZF, PF, CF := 100;

FCOS—Cosine

| Opcode | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|--------|-------------|-------------|------------------|--|
| D9 FF | FCOS | Valid | Valid | Replace ST(0) with its approximate cosine. |

Description

Computes the approximate cosine of the source operand in register ST(0) and stores the result in ST(0). The source operand must be given in radians and must be within the range -2^{63} to $+2^{63}$. The following table shows the results obtained when taking the cosine of various classes of numbers.

Table 3-32. FCOS Results

| ST(0) SRC | ST(0) DEST |
|-----------|--------------|
| $-\infty$ | * |
| $-F$ | -1 to $+1$ |
| -0 | $+1$ |
| $+0$ | $+1$ |
| $+F$ | -1 to $+1$ |
| $+\infty$ | * |
| NaN | NaN |

NOTES:

- F Means finite floating-point value.
- * Indicates floating-point invalid-arithmetic-operand (#IA) exception.

If the source operand is outside the acceptable range, the C2 flag in the FPU status word is set, and the value in register ST(0) remains unchanged. The instruction does not raise an exception when the source operand is out of range. It is up to the program to check the C2 flag for out-of-range conditions. Source values outside the range -2^{63} to $+2^{63}$ can be reduced to the range of the instruction by subtracting an appropriate integer multiple of 2π . However, even within the range -2^{63} to $+2^{63}$, inaccurate results can occur because the finite approximation of π used internally for argument reduction is not sufficient in all cases. Therefore, for accurate results it is safe to apply FCOS only to arguments reduced accurately in software, to a value smaller in absolute value than $3\pi/8$. See the sections titled “Approximation of Pi” and “Transcendental Instruction Accuracy” in Chapter 8 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1, for a discussion of the proper value to use for π in performing such reductions.

This instruction’s operation is the same in non-64-bit modes and 64-bit mode.

Operation

```
IF |ST(0)| < 263
THEN
    C2 := 0;
    ST(0) := FCOS(ST(0)); // approximation of cosine
ELSE (* Source operand is out-of-range *)
    C2 := 1;
FI;
```

FPU Flags Affected

| | |
|--------|--|
| C1 | Set to 0 if stack underflow occurred. Set if result was rounded up; cleared otherwise. Undefined if C2 is 1. |
| C2 | Set to 1 if outside range ($-2^{63} < \text{source operand} < +2^{63}$); otherwise, set to 0. |
| C0, C3 | Undefined. |

Floating-Point Exceptions

| | |
|-----|--|
| #IS | Stack underflow occurred. |
| #IA | Source operand is an SNaN value, ∞ , or unsupported format. |
| #D | Source is a denormal value. |
| #P | Value cannot be represented exactly in destination format. |

Protected Mode Exceptions

| | |
|-----|--|
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |

FDECSTP—Decrement Stack-Top Pointer

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------------|-----------------|---|
| D9 F6 | FDECSTP | Valid | Valid | Decrement TOP field in FPU status word. |

Description

Subtracts one from the TOP field of the FPU status word (decrements the top-of-stack pointer). If the TOP field contains a 0, it is set to 7. The effect of this instruction is to rotate the stack by one position. The contents of the FPU data registers and tag register are not affected.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

```
IF TOP = 0
    THEN TOP := 7;
    ELSE TOP := TOP - 1;
FI;
```

FPU Flags Affected

The C1 flag is set to 0. The C0, C2, and C3 flags are undefined.

Floating-Point Exceptions

None.

Protected Mode Exceptions

#NM CR0.EM[bit 2] or CR0.TS[bit 3] = 1.
#MF If there is a pending x87 FPU exception.
#UD If the LOCK prefix is used.

FDIV/FDIVP/FIDIV—Divide

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|---------|--------------------|-------------|-----------------|---|
| D8 /6 | FDIV m32fp | Valid | Valid | Divide ST(0) by m32fp and store result in ST(0). |
| DC /6 | FDIV m64fp | Valid | Valid | Divide ST(0) by m64fp and store result in ST(0). |
| D8 F0+i | FDIV ST(0), ST(i) | Valid | Valid | Divide ST(0) by ST(i) and store result in ST(0). |
| DC F8+i | FDIV ST(i), ST(0) | Valid | Valid | Divide ST(i) by ST(0) and store result in ST(i). |
| DE F8+i | FDIVP ST(i), ST(0) | Valid | Valid | Divide ST(i) by ST(0), store result in ST(i), and pop the register stack. |
| DE F9 | FDIVP | Valid | Valid | Divide ST(1) by ST(0), store result in ST(1), and pop the register stack. |
| DA /6 | FIDIV m32int | Valid | Valid | Divide ST(0) by m32int and store result in ST(0). |
| DE /6 | FIDIV m16int | Valid | Valid | Divide ST(0) by m16int and store result in ST(0). |

Description

Divides the destination operand by the source operand and stores the result in the destination location. The destination operand (dividend) is always in an FPU register; the source operand (divisor) can be a register or a memory location. Source operands in memory can be in single precision or double precision floating-point format, word or doubleword integer format.

The no-operand version of the instruction divides the contents of the ST(1) register by the contents of the ST(0) register. The one-operand version divides the contents of the ST(0) register by the contents of a memory location (either a floating-point or an integer value). The two-operand version, divides the contents of the ST(0) register by the contents of the ST(i) register or vice versa.

The FDIVP instructions perform the additional operation of popping the FPU register stack after storing the result. To pop the register stack, the processor marks the ST(0) register as empty and increments the stack pointer (TOP) by 1. The no-operand version of the floating-point divide instructions always results in the register stack being popped. In some assemblers, the mnemonic for this instruction is FDIV rather than FDIVP.

The FIDIV instructions convert an integer source operand to double extended-precision floating-point format before performing the division. When the source operand is an integer 0, it is treated as a +0.

If an unmasked divide-by-zero exception (#Z) is generated, no result is stored; if the exception is masked, an ∞ of the appropriate sign is stored in the destination operand.

The following table shows the results obtained when dividing various classes of numbers, assuming that neither overflow nor underflow occurs.

Table 3-33. FDIV/FDIVP/FIDIV Results

| | | DEST | | | | | | |
|-----|-----------|-----------|------|------|------|------|-----------|-----|
| SRC | | $-\infty$ | $-F$ | -0 | $+0$ | $+F$ | $+\infty$ | NaN |
| | $-\infty$ | * | $+0$ | $+0$ | -0 | -0 | * | NaN |
| | $-F$ | $+\infty$ | $+F$ | $+0$ | -0 | $-F$ | $-\infty$ | NaN |
| | $-I$ | $+\infty$ | $+F$ | $+0$ | -0 | $-F$ | $-\infty$ | NaN |
| | -0 | $+\infty$ | ** | * | * | ** | $-\infty$ | NaN |
| | $+0$ | $-\infty$ | ** | * | * | ** | $+\infty$ | NaN |
| | $+I$ | $-\infty$ | $-F$ | -0 | $+0$ | $+F$ | $+\infty$ | NaN |
| | $+F$ | $-\infty$ | $-F$ | -0 | $+0$ | $+F$ | $+\infty$ | NaN |
| | $+\infty$ | * | -0 | -0 | $+0$ | $+0$ | * | NaN |
| | NaN | NaN | NaN | NaN | NaN | NaN | NaN | NaN |

NOTES:

F Means finite floating-point value.

I Means integer.

* Indicates floating-point invalid-arithmetic-operand (#IA) exception.

** Indicates floating-point zero-divide (#Z) exception.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

```

IF SRC = 0
    THEN
        #Z;
    ELSE
        IF Instruction is FIDIV
            THEN
                DEST := DEST / ConvertToDoubleExtendedPrecisionFP(SRC);
            ELSE (* Source operand is floating-point value *)
                DEST := DEST / SRC;
        FI;
    FI;
IF Instruction = FDIVP
    THEN
        PopRegisterStack;
    FI;

```

FPU Flags Affected

C1 Set to 0 if stack underflow occurred.

Set if result was rounded up; cleared otherwise.

C0, C2, C3 Undefined.

Floating-Point Exceptions

| | |
|-----|--|
| #IS | Stack underflow occurred. |
| #IA | Operand is an SNaN value or unsupported format. $\pm\infty / \pm\infty$; $\pm 0 / \pm 0$ |
| #D | Source is a denormal value. |
| #Z | DEST / ± 0 , where DEST is not equal to ± 0 . |
| #U | Result is too small for destination format. |
| #O | Result is too large for destination format. |
| #P | Value cannot be represented exactly in destination format. |

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |

| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

FDIVR/FDIVRP/FIDIVR—Reverse Divide

| Opcode | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|---------|---------------------|-------------|------------------|---|
| D8 /7 | FDIVR m32fp | Valid | Valid | Divide m32fp by ST(0) and store result in ST(0). |
| DC /7 | FDIVR m64fp | Valid | Valid | Divide m64fp by ST(0) and store result in ST(0). |
| D8 F8+i | FDIVR ST(0), ST(i) | Valid | Valid | Divide ST(i) by ST(0) and store result in ST(0). |
| DC F0+i | FDIVR ST(i), ST(0) | Valid | Valid | Divide ST(0) by ST(i) and store result in ST(i). |
| DE F0+i | FDIVRP ST(i), ST(0) | Valid | Valid | Divide ST(0) by ST(i), store result in ST(i), and pop the register stack. |
| DE F1 | FDIVRP | Valid | Valid | Divide ST(0) by ST(1), store result in ST(1), and pop the register stack. |
| DA /7 | FIDIVR m32int | Valid | Valid | Divide m32int by ST(0) and store result in ST(0). |
| DE /7 | FIDIVR m16int | Valid | Valid | Divide m16int by ST(0) and store result in ST(0). |

Description

Divides the source operand by the destination operand and stores the result in the destination location. The destination operand (divisor) is always in an FPU register; the source operand (dividend) can be a register or a memory location. Source operands in memory can be in single precision or double precision floating-point format, word or doubleword integer format.

These instructions perform the reverse operations of the FDIV, FDIVP, and FIDIV instructions. They are provided to support more efficient coding.

The no-operand version of the instruction divides the contents of the ST(0) register by the contents of the ST(1) register. The one-operand version divides the contents of a memory location (either a floating-point or an integer value) by the contents of the ST(0) register. The two-operand version, divides the contents of the ST(i) register by the contents of the ST(0) register or vice versa.

The FDIVRP instructions perform the additional operation of popping the FPU register stack after storing the result. To pop the register stack, the processor marks the ST(0) register as empty and increments the stack pointer (TOP) by 1. The no-operand version of the floating-point divide instructions always results in the register stack being popped. In some assemblers, the mnemonic for this instruction is FDIVR rather than FDIVRP.

The FIDIVR instructions convert an integer source operand to double extended-precision floating-point format before performing the division.

If an unmasked divide-by-zero exception (#Z) is generated, no result is stored; if the exception is masked, an ∞ of the appropriate sign is stored in the destination operand.

The following table shows the results obtained when dividing various classes of numbers, assuming that neither overflow nor underflow occurs.

Table 3-34. FDIVR/FDIVRP/FIDIVR Results

| SRC | DEST | | | | | | |
|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----|
| | $-\infty$ | $-F$ | -0 | $+0$ | $+F$ | $+\infty$ | NaN |
| $-\infty$ | * | $+\infty$ | $+\infty$ | $-\infty$ | $-\infty$ | * | NaN |
| $-F$ | $+0$ | $+F$ | ** | ** | $-F$ | -0 | NaN |
| $-I$ | $+0$ | $+F$ | ** | ** | $-F$ | -0 | NaN |
| -0 | $+0$ | $+0$ | * | * | -0 | -0 | NaN |
| $+0$ | -0 | -0 | * | * | $+0$ | $+0$ | NaN |
| $+I$ | -0 | $-F$ | ** | ** | $+F$ | $+0$ | NaN |
| $+F$ | -0 | $-F$ | ** | ** | $+F$ | $+0$ | NaN |
| $+\infty$ | * | $-\infty$ | $-\infty$ | $+\infty$ | $+\infty$ | * | NaN |
| NaN | NaN | NaN | NaN | NaN | NaN | NaN | NaN |

NOTES:

F Means finite floating-point value.

I Means integer.

* Indicates floating-point invalid-arithmetic-operand (#IA) exception.

** Indicates floating-point zero-divide (#Z) exception.

When the source operand is an integer 0, it is treated as a +0. This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

```

IF DEST = 0
  THEN
    #Z;
  ELSE
    IF Instruction = FIDIVR
      THEN
        DEST := ConvertToDoubleExtendedPrecisionFP(SRC) / DEST;
      ELSE (* Source operand is floating-point value *)
        DEST := SRC / DEST;
    FI;
  FI;
IF Instruction = FDIVRP
  THEN
    PopRegisterStack;
  FI;

```

FPU Flags Affected

C1 Set to 0 if stack underflow occurred.

Set if result was rounded up; cleared otherwise.

C0, C2, C3 Undefined.

Floating-Point Exceptions

| | |
|-----|--|
| #IS | Stack underflow occurred. |
| #IA | Operand is an SNaN value or unsupported format. $\pm\infty / \pm\infty$; $\pm 0 / \pm 0$ |
| #D | Source is a denormal value. |
| #Z | SRC / ± 0 , where SRC is not equal to ± 0 . |
| #U | Result is too small for destination format. |
| #O | Result is too large for destination format. |
| #P | Value cannot be represented exactly in destination format. |

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|---------------|-------------|-----------------|---|
| DE /2 | FICOM m16int | Valid | Valid | Compare ST(0) with m16int. |
| DA /2 | FICOM m32int | Valid | Valid | Compare ST(0) with m32int. |
| DE /3 | FICOMP m16int | Valid | Valid | Compare ST(0) with m16int and pop stack register. |
| DA /3 | FICOMP m32int | Valid | Valid | Compare ST(0) with m32int and pop stack register. |

Description

Compares the value in ST(0) with an integer source operand and sets the condition code flags C0, C2, and C3 in the FPU status word according to the results (see table below). The integer value is converted to double extended-precision floating-point format before the comparison is made.

Table 3-35. FICOM/FICOMP Results

| Condition | C3 | C2 | C0 |
|-------------|----|----|----|
| ST(0) > SRC | 0 | 0 | 0 |
| ST(0) < SRC | 0 | 0 | 1 |
| ST(0) = SRC | 1 | 0 | 0 |
| Unordered | 1 | 1 | 1 |

These instructions perform an “unordered comparison.” An unordered comparison also checks the class of the numbers being compared (see “FXAM—Examine Floating-Point” in this chapter). If either operand is a NaN or is in an undefined format, the condition flags are set to “unordered.”

The sign of zero is ignored, so that $-0.0 := +0.0$.

The FICOMP instructions pop the register stack following the comparison. To pop the register stack, the processor marks the ST(0) register empty and increments the stack pointer (TOP) by 1.

This instruction’s operation is the same in non-64-bit modes and 64-bit mode.

Operation

CASE (relation of operands) OF

ST(0) > SRC: C3, C2, C0 := 000;

ST(0) < SRC: C3, C2, C0 := 001;

ST(0) = SRC: C3, C2, C0 := 100;

Unordered: C3, C2, C0 := 111;

ESAC;

IF Instruction = FICOMP

THEN

PopRegisterStack;

FI;

FPU Flags Affected

C1 Set to 0.

C0, C2, C3 See table on previous page.

Floating-Point Exceptions

#IS Stack underflow occurred.

#IA One or both operands are NaN values or have unsupported formats.

#D One or both operands are denormal values.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

FILD—Load Integer

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------------|-----------------|--|
| DF /0 | FILD m16int | Valid | Valid | Push m16int onto the FPU register stack. |
| DB /0 | FILD m32int | Valid | Valid | Push m32int onto the FPU register stack. |
| DF /5 | FILD m64int | Valid | Valid | Push m64int onto the FPU register stack. |

Description

Converts the signed-integer source operand into double extended-precision floating-point format and pushes the value onto the FPU register stack. The source operand can be a word, doubleword, or quadword integer. It is loaded without rounding errors. The sign of the source operand is preserved.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

TOP := TOP – 1;

ST(0) := ConvertToDoubleExtendedPrecisionFP(SRC);

FPU Flags Affected

C1 Set to 1 if stack overflow occurred; set to 0 otherwise.

C0, C2, C3 Undefined.

Floating-Point Exceptions

#IS Stack overflow occurred.

Protected Mode Exceptions

#GP(0) If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.

If the DS, ES, FS, or GS register contains a NULL segment selector.

#SS(0) If a memory operand effective address is outside the SS segment limit.

#NM CR0.EM[bit 2] or CR0.TS[bit 3] = 1.

#PF(fault-code) If a page fault occurs.

#AC(0) If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3.

#UD If the LOCK prefix is used.

Real-Address Mode Exceptions

#GP If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.

#SS If a memory operand effective address is outside the SS segment limit.

#NM CR0.EM[bit 2] or CR0.TS[bit 3] = 1.

#UD If the LOCK prefix is used.

Virtual-8086 Mode Exceptions

#GP(0) If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.

#SS(0) If a memory operand effective address is outside the SS segment limit.

#NM CR0.EM[bit 2] or CR0.TS[bit 3] = 1.

#PF(fault-code) If a page fault occurs.

#AC(0) If alignment checking is enabled and an unaligned memory reference is made.

#UD If the LOCK prefix is used.

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

FINCSTP—Increment Stack-Top Pointer

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------------|-----------------|---|
| D9 F7 | FINCSTP | Valid | Valid | Increment the TOP field in the FPU status register. |

Description

Adds one to the TOP field of the FPU status word (increments the top-of-stack pointer). If the TOP field contains a 7, it is set to 0. The effect of this instruction is to rotate the stack by one position. The contents of the FPU data registers and tag register are not affected. This operation is not equivalent to popping the stack, because the tag for the previous top-of-stack register is not marked empty.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

```
IF TOP = 7
    THEN TOP := 0;
    ELSE TOP := TOP + 1;
FI;
```

FPU Flags Affected

The C1 flag is set to 0. The C0, C2, and C3 flags are undefined.

Floating-Point Exceptions

None.

Protected Mode Exceptions

#NM CR0.EM[bit 2] or CR0.TS[bit 3] = 1.
#MF If there is a pending x87 FPU exception.
#UD If the LOCK prefix is used.

Real-Address Mode Exceptions

Same exceptions as in protected mode.

Virtual-8086 Mode Exceptions

Same exceptions as in protected mode.

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

Same exceptions as in protected mode.

FINIT/FNINIT—Initialize Floating-Point Unit

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|----------|---------------------|-------------|-----------------|---|
| 9B DB E3 | FINIT | Valid | Valid | Initialize FPU after checking for pending unmasked floating-point exceptions. |
| DB E3 | FNINIT ¹ | Valid | Valid | Initialize FPU without checking for pending unmasked floating-point exceptions. |

NOTES:

1. See IA-32 Architecture Compatibility section below.

Description

Sets the FPU control, status, tag, instruction pointer, and data pointer registers to their default states. The FPU control word is set to 037FH (round to nearest, all exceptions masked, 64-bit precision). The status word is cleared (no exception flags set, TOP is set to 0). The data registers in the register stack are left unchanged, but they are all tagged as empty (11B). Both the instruction and data pointers are cleared.

The FINIT instruction checks for and handles any pending unmasked floating-point exceptions before performing the initialization; the FNINIT instruction does not.

The assembler issues two instructions for the FINIT instruction (an FWAIT instruction followed by an FNINIT instruction), and the processor executes each of these instructions separately. If an exception is generated for either of these instructions, the save EIP points to the instruction that caused the exception.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

IA-32 Architecture Compatibility

When operating a Pentium or Intel486 processor in MS-DOS compatibility mode, it is possible (under unusual circumstances) for an FNINIT instruction to be interrupted prior to being executed to handle a pending FPU exception. See the section titled "No-Wait FPU Instructions Can Get FPU Interrupt in Window" in Appendix D of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, for a description of these circumstances. An FNINIT instruction cannot be interrupted in this way on later Intel processors, except for the Intel Quark™ X1000 processor.

In the Intel387 math coprocessor, the FINIT/FNINIT instruction does not clear the instruction and data pointers.

This instruction affects only the x87 FPU. It does not affect the XMM and MXCSR registers.

Operation

```
FPUControlWord := 037FH;  
FPUStatusWord := 0;  
FPUTagWord := FFFFH;  
FPUDataPointer := 0;  
FPUInstructionPointer := 0;  
FPULastInstructionOpcode := 0;
```

FPU Flags Affected

C0, C1, C2, C3 set to 0.

Floating-Point Exceptions

None.

Protected Mode Exceptions

| | |
|-----|--|
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

Same exceptions as in protected mode.

Virtual-8086 Mode Exceptions

Same exceptions as in protected mode.

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

Same exceptions as in protected mode.

FIST/FISTP—Store Integer

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|--------------|-------------|-----------------|---|
| DF /2 | FIST m16int | Valid | Valid | Store ST(0) in m16int. |
| DB /2 | FIST m32int | Valid | Valid | Store ST(0) in m32int. |
| DF /3 | FISTP m16int | Valid | Valid | Store ST(0) in m16int and pop register stack. |
| DB /3 | FISTP m32int | Valid | Valid | Store ST(0) in m32int and pop register stack. |
| DF /7 | FISTP m64int | Valid | Valid | Store ST(0) in m64int and pop register stack. |

Description

The FIST instruction converts the value in the ST(0) register to a signed integer and stores the result in the destination operand. Values can be stored in word or doubleword integer format. The destination operand specifies the address where the first byte of the destination value is to be stored.

The FISTP instruction performs the same operation as the FIST instruction and then pops the register stack. To pop the register stack, the processor marks the ST(0) register as empty and increments the stack pointer (TOP) by 1. The FISTP instruction also stores values in quadword integer format.

The following table shows the results obtained when storing various classes of numbers in integer format.

Table 3-36. FIST/FISTP Results

| ST(0) | DEST |
|--|------|
| $-\infty$ or Value Too Large for DEST Format | * |
| $F \leq -1$ | $-I$ |
| $-1 < F < -0$ | ** |
| -0 | 0 |
| $+0$ | 0 |
| $+0 < F < +1$ | ** |
| $F \geq +1$ | $+I$ |
| $+\infty$ or Value Too Large for DEST Format | * |
| NaN | * |

NOTES:

F Means finite floating-point value.

I Means integer.

* Indicates floating-point invalid-operation (#IA) exception.

** 0 or ± 1 , depending on the rounding mode.

If the source value is a non-integral value, it is rounded to an integer value, according to the rounding mode specified by the RC field of the FPU control word.

If the converted value is too large for the destination format, or if the source operand is an ∞ , SNaN, QNaN, or is in an unsupported format, an invalid-arithmetic-operand condition is signaled. If the invalid-operation exception is not masked, an invalid-arithmetic-operand exception (#IA) is generated and no value is stored in the destination operand. If the invalid-operation exception is masked, the integer indefinite value is stored in memory.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

```
DEST := Integer(ST(0));  
IF Instruction = FISTP  
    THEN  
        PopRegisterStack;  
FI;
```

FPU Flags Affected

| | |
|------------|---|
| C1 | Set to 0 if stack underflow occurred. Indicates rounding direction of if the inexact exception (#P) is generated: 0 := not roundup; 1 := roundup. Set to 0 otherwise. |
| C0, C2, C3 | Undefined. |

Floating-Point Exceptions

| | |
|-----|---|
| #IS | Stack underflow occurred. |
| #IA | Converted value is too large for the destination format. Source operand is an SNaN, QNaN, $\pm\infty$, or unsupported format. |
| #P | Value cannot be represented exactly in destination format. |

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If the destination is located in a non-writable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register is used to access memory and it contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

FISTTP—Store Integer With Truncation

| Opcode | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|--------|---------------|-------------|---------------------|--|
| DF /1 | FISTTP m16int | Valid | Valid | Store ST(0) in m16int with truncation. |
| DB /1 | FISTTP m32int | Valid | Valid | Store ST(0) in m32int with truncation. |
| DD /1 | FISTTP m64int | Valid | Valid | Store ST(0) in m64int with truncation. |

Description

FISTTP converts the value in ST into a signed integer using truncation (chop) as rounding mode, transfers the result to the destination, and pop ST. FISTTP accepts word, short integer, and long integer destinations.

The following table shows the results obtained when storing various classes of numbers in integer format.

Table 3-37. FISTTP Results

| ST(0) | DEST |
|--|------|
| $-\infty$ or Value Too Large for DEST Format | * |
| $F \leq -1$ | $-I$ |
| $-1 < F < +1$ | 0 |
| $F \leq +1$ | $+I$ |
| $+\infty$ or Value Too Large for DEST Format | * |
| NaN | * |

NOTES:

F Means finite floating-point value.

I Means integer.

* Indicates floating-point invalid-operation (#IA) exception.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

DEST := ST;

pop ST;

Flags Affected

C1 is cleared; C0, C2, C3 undefined.

Numeric Exceptions

Invalid, Stack Invalid (stack underflow), Precision.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If the destination is in a nonwritable segment. For an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. |
| #SS(0) | For an illegal address in the SS segment. |
| #PF(fault-code) | For a page fault. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #NM | If CR0.EM[bit 2] = 1. If CR0.TS[bit 3] = 1. |
| #UD | If CPUID.01H:ECX.SSE3[bit 0] = 0. If the LOCK prefix is used. |

Real Address Mode Exceptions

| | |
|-------|---|
| GP(0) | If any part of the operand would lie outside of the effective address space from 0 to 0FFFFH. |
| #NM | If CR0.EM[bit 2] = 1. If CR0.TS[bit 3] = 1. |
| #UD | If CPUID.01H:ECX.SSE3[bit 0] = 0. If the LOCK prefix is used. |

Virtual 8086 Mode Exceptions

| | |
|-----------------|---|
| GP(0) | If any part of the operand would lie outside of the effective address space from 0 to 0FFFFH. |
| #NM | If CR0.EM[bit 2] = 1. If CR0.TS[bit 3] = 1. |
| #UD | If CPUID.01H:ECX.SSE3[bit 0] = 0. If the LOCK prefix is used. |
| #PF(fault-code) | For a page fault. |
| #AC(0) | For unaligned memory reference if the current privilege is 3. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|---|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. If the LOCK prefix is used. |

FLD—Load Floating-Point Value

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|---------|-------------|-------------|-----------------|---|
| D9 /0 | FLD m32fp | Valid | Valid | Push m32fp onto the FPU register stack. |
| DD /0 | FLD m64fp | Valid | Valid | Push m64fp onto the FPU register stack. |
| DB /5 | FLD m80fp | Valid | Valid | Push m80fp onto the FPU register stack. |
| D9 C0+i | FLD ST(i) | Valid | Valid | Push ST(i) onto the FPU register stack. |

Description

Pushes the source operand onto the FPU register stack. The source operand can be in single precision, double precision, or double extended-precision floating-point format. If the source operand is in single precision or double precision floating-point format, it is automatically converted to the double extended-precision floating-point format before being pushed on the stack.

The FLD instruction can also push the value in a selected FPU register [ST(i)] onto the stack. Here, pushing register ST(0) duplicates the stack top.

NOTE

When the FLD instruction loads a denormal value and the DM bit in the CW is not masked, an exception is flagged but the value is still pushed onto the x87 stack.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

```
IF SRC is ST(i)
    THEN
        temp := ST(i);
FI;
TOP := TOP – 1;
IF SRC is memory-operand
    THEN
        ST(0) := ConvertToDoubleExtendedPrecisionFP(SRC);
    ELSE (* SRC is ST(i) *)
        ST(0) := temp;
FI;
```

FPU Flags Affected

C1 Set to 1 if stack overflow occurred; otherwise, set to 0.
C0, C2, C3 Undefined.

Floating-Point Exceptions

#IS Stack underflow or overflow occurred.
#IA Source operand is an SNaN. Does not occur if the source operand is in double extended-precision floating-point format (FLD m80fp or FLD ST(i)).
#D Source operand is a denormal value. Does not occur if the source operand is in double extended-precision floating-point format.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If destination is located in a non-writable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register is used to access memory and it contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

FLD1/FLDL2T/FLDL2E/FLDPI/FLDLG2/FLDLN2/FLDZ—Load Constant

| Opcode* | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|---------|-------------|-------------|------------------|---|
| D9 E8 | FLD1 | Valid | Valid | Push +1.0 onto the FPU register stack. |
| D9 E9 | FLDL2T | Valid | Valid | Push $\log_2 10$ onto the FPU register stack. |
| D9 EA | FLDL2E | Valid | Valid | Push $\log_2 e$ onto the FPU register stack. |
| D9 EB | FLDPI | Valid | Valid | Push π onto the FPU register stack. |
| D9 EC | FLDLG2 | Valid | Valid | Push $\log_{10} 2$ onto the FPU register stack. |
| D9 ED | FLDLN2 | Valid | Valid | Push $\log_e 2$ onto the FPU register stack. |
| D9 EE | FLDZ | Valid | Valid | Push +0.0 onto the FPU register stack. |

NOTES:

* See IA-32 Architecture Compatibility section below.

Description

Push one of seven commonly used constants (in double extended-precision floating-point format) onto the FPU register stack. The constants that can be loaded with these instructions include +1.0, +0.0, $\log_2 10$, $\log_2 e$, π , $\log_{10} 2$, and $\log_e 2$. For each constant, an internal 66-bit constant is rounded (as specified by the RC field in the FPU control word) to double extended-precision floating-point format. The inexact-result exception (#P) is not generated as a result of the rounding, nor is the C1 flag set in the x87 FPU status word if the value is rounded up.

See the section titled “Approximation of Pi” in Chapter 8 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1, for a description of the π constant.

This instruction’s operation is the same in non-64-bit modes and 64-bit mode.

IA-32 Architecture Compatibility

When the RC field is set to round-to-nearest, the FPU produces the same constants that is produced by the Intel 8087 and Intel 287 math coprocessors.

Operation

TOP := TOP – 1;

ST(0) := CONSTANT;

FPU Flags Affected

C1 Set to 1 if stack overflow occurred; otherwise, set to 0.

C0, C2, C3 Undefined.

Floating-Point Exceptions

#IS Stack overflow occurred.

Protected Mode Exceptions

FLDCW—Load x87 FPU Control Word

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|--------------|-------------|-----------------|------------------------------------|
| D9 /5 | FLDCW m2byte | Valid | Valid | Load FPU control word from m2byte. |

Description

Loads the 16-bit source operand into the FPU control word. The source operand is a memory location. This instruction is typically used to establish or change the FPU's mode of operation.

If one or more exception flags are set in the FPU status word prior to loading a new FPU control word and the new control word unmask one or more of those exceptions, a floating-point exception will be generated upon execution of the next floating-point instruction (except for the no-wait floating-point instructions, see the section titled "Software Exception Handling" in Chapter 8 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1). To avoid raising exceptions when changing FPU operating modes, clear any pending exceptions (using the FCLEX or FNCLEX instruction) before loading the new control word.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

FPUControlWord := SRC;

FPU Flags Affected

C0, C1, C2, C3 undefined.

Floating-Point Exceptions

None; however, this operation might unmask a pending exception in the FPU status word. That exception is then generated upon execution of the next "waiting" floating-point instruction.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register is used to access memory and it contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

FLDENV—Load x87 FPU Environment

| Opcode | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|--------|-------------------|-------------|------------------|---|
| D9 /4 | FLDENV m14/28byte | Valid | Valid | Load FPU environment from m14byte or m28byte. |

Description

Loads the complete x87 FPU operating environment from memory into the FPU registers. The source operand specifies the first byte of the operating-environment data in memory. This data is typically written to the specified memory location by a FSTENV or FNSTENV instruction.

The FPU operating environment consists of the FPU control word, status word, tag word, instruction pointer, data pointer, and last opcode. Figures 8-9 through 8-12 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, show the layout in memory of the loaded environment, depending on the operating mode of the processor (protected or real) and the current operand-size attribute (16-bit or 32-bit). In virtual-8086 mode, the real mode layouts are used.

The FLDENV instruction should be executed in the same operating mode as the corresponding FSTENV/FNSTENV instruction.

If one or more unmasked exception flags are set in the new FPU status word, a floating-point exception will be generated upon execution of the next floating-point instruction (except for the no-wait floating-point instructions, see the section titled "Software Exception Handling" in Chapter 8 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1). To avoid generating exceptions when loading a new environment, clear all the exception flags in the FPU status word that is being loaded.

If a page or limit fault occurs during the execution of this instruction, the state of the x87 FPU registers as seen by the fault handler may be different than the state being loaded from memory. In such situations, the fault handler should ignore the status of the x87 FPU registers, handle the fault, and return. The FLDENV instruction will then complete the loading of the x87 FPU registers with no resulting context inconsistency.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

```
FPUControlWord := SRC[FPUControlWord];
FPUStatusWord := SRC[FPUStatusWord];
FPUTagWord := SRC[FPUTagWord];
FPUDataPointer := SRC[FPUDataPointer];
FPUInstructionPointer := SRC[FPUInstructionPointer];
FPULastInstructionOpcode := SRC[FPULastInstructionOpcode];
```

FPU Flags Affected

The C0, C1, C2, C3 flags are loaded.

Floating-Point Exceptions

None; however, if an unmasked exception is loaded in the status word, it is generated upon execution of the next "waiting" floating-point instruction.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register is used to access memory and it contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

FMUL/FMULP/FIMUL—Multiply

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|---------|--------------------|-------------|-----------------|---|
| D8 /1 | FMUL m32fp | Valid | Valid | Multiply ST(0) by m32fp and store result in ST(0). |
| DC /1 | FMUL m64fp | Valid | Valid | Multiply ST(0) by m64fp and store result in ST(0). |
| D8 C8+i | FMUL ST(0), ST(i) | Valid | Valid | Multiply ST(0) by ST(i) and store result in ST(0). |
| DC C8+i | FMUL ST(i), ST(0) | Valid | Valid | Multiply ST(i) by ST(0) and store result in ST(i). |
| DE C8+i | FMULP ST(i), ST(0) | Valid | Valid | Multiply ST(i) by ST(0), store result in ST(i), and pop the register stack. |
| DE C9 | FMULP | Valid | Valid | Multiply ST(1) by ST(0), store result in ST(1), and pop the register stack. |
| DA /1 | FIMUL m32int | Valid | Valid | Multiply ST(0) by m32int and store result in ST(0). |
| DE /1 | FIMUL m16int | Valid | Valid | Multiply ST(0) by m16int and store result in ST(0). |

Description

Multiplies the destination and source operands and stores the product in the destination location. The destination operand is always an FPU data register; the source operand can be an FPU data register or a memory location. Source operands in memory can be in single precision or double precision floating-point format or in word or doubleword integer format.

The no-operand version of the instruction multiplies the contents of the ST(1) register by the contents of the ST(0) register and stores the product in the ST(1) register. The one-operand version multiplies the contents of the ST(0) register by the contents of a memory location (either a floating-point or an integer value) and stores the product in the ST(0) register. The two-operand version, multiplies the contents of the ST(0) register by the contents of the ST(i) register, or vice versa, with the result being stored in the register specified with the first operand (the destination operand).

The FMULP instructions perform the additional operation of popping the FPU register stack after storing the product. To pop the register stack, the processor marks the ST(0) register as empty and increments the stack pointer (TOP) by 1. The no-operand version of the floating-point multiply instructions always results in the register stack being popped. In some assemblers, the mnemonic for this instruction is FMUL rather than FMULP.

The FIMUL instructions convert an integer source operand to double extended-precision floating-point format before performing the multiplication.

The sign of the result is always the exclusive-OR of the source signs, even if one or more of the values being multiplied is 0 or ∞ . When the source operand is an integer 0, it is treated as a +0.

The following table shows the results obtained when multiplying various classes of numbers, assuming that neither overflow nor underflow occurs.

Table 3-38. FMUL/FMULP/FIMUL Results

| SRC | DEST | | | | | | |
|-----|-----------|-----------|-----------|------|------|-----------|-----------|
| | | $-\infty$ | $-F$ | -0 | $+0$ | $+F$ | $+\infty$ |
| | $-\infty$ | $+\infty$ | $+\infty$ | * | * | $-\infty$ | $-\infty$ |
| | $-F$ | $+\infty$ | $+F$ | $+0$ | -0 | $-F$ | $-\infty$ |
| | $-I$ | $+\infty$ | $+F$ | $+0$ | -0 | $-F$ | $-\infty$ |
| | -0 | * | $+0$ | $+0$ | -0 | -0 | * |
| | $+0$ | * | -0 | -0 | $+0$ | $+0$ | * |
| | $+I$ | $-\infty$ | $-F$ | -0 | $+0$ | $+F$ | $+\infty$ |
| | $+F$ | $-\infty$ | $-F$ | -0 | $+0$ | $+F$ | $+\infty$ |
| | $+\infty$ | $-\infty$ | $-\infty$ | * | * | $+\infty$ | $+\infty$ |
| | NaN | NaN | NaN | NaN | NaN | NaN | NaN |

NOTES:

F Means finite floating-point value.

I Means Integer.

* Indicates invalid-arithmetic-operand (#IA) exception.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

IF Instruction = FIMUL

THEN

DEST := DEST * ConvertToDoubleExtendedPrecisionFP(SRC);

ELSE (* Source operand is floating-point value *)

DEST := DEST * SRC;

FI;

IF Instruction = FMULP

THEN

PopRegisterStack;

FNOP—No Operation

| Opcode | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|--------|-------------|-------------|------------------|----------------------------|
| D9 D0 | FNOP | Valid | Valid | No operation is performed. |

Description

Performs no FPU operation. This instruction takes up space in the instruction stream but does not affect the FPU or machine context, except the EIP register and the FPU Instruction Pointer.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

FPU Flags Affected

C0, C1, C2, C3 undefined.

Floating-Point Exceptions

None.

Protected Mode Exceptions

- #NM CR0.EM[bit 2] or CR0.TS[bit 3] = 1.
- #MF If there is a pending x87 FPU exception.
- #UD If the LOCK prefix is used.

Real-Address Mode Exceptions

Same exceptions as in protected mode.

FPATAN—Partial Arctangent

| Opcode ¹ | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|---------------------|-------------|-------------|-----------------|---|
| D9 F3 | FPATAN | Valid | Valid | Replace ST(1) with $\arctan(\text{ST}(1)/\text{ST}(0))$ and pop the register stack. |

NOTES:

1. See IA-32 Architecture Compatibility section below.

Description

Computes the arctangent of the source operand in register ST(1) divided by the source operand in register ST(0), stores the result in ST(1), and pops the FPU register stack. The result in register ST(0) has the same sign as the source operand ST(1) and a magnitude less than $+\pi$.

The FPATAN instruction returns the angle between the X axis and the line from the origin to the point (X,Y), where Y (the ordinate) is ST(1) and X (the abscissa) is ST(0). The angle depends on the sign of X and Y independently, not just on the sign of the ratio Y/X. This is because a point (–X,Y) is in the second quadrant, resulting in an angle between $\pi/2$ and π , while a point (X,–Y) is in the fourth quadrant, resulting in an angle between 0 and $-\pi/2$. A point (–X,–Y) is in the third quadrant, giving an angle between $-\pi/2$ and $-\pi$.

The following table shows the results obtained when computing the arctangent of various classes of numbers, assuming that underflow does not occur.

Table 3-39. FPATAN Results

| | | ST(0) | | | | | | |
|-------|-----------|-------------|--------------------|-----------------|----------|------------------|------------|-----|
| ST(1) | | $-\infty$ | $-F$ | -0 | $+0$ | $+F$ | $+\infty$ | NaN |
| | $-\infty$ | $-3\pi/4^*$ | $-\pi/2$ | $-\pi/2$ | $-\pi/2$ | $-\pi/2$ | $-\pi/4^*$ | NaN |
| | $-F$ | -p | $-\pi$ to $-\pi/2$ | $-\pi/2$ | $-\pi/2$ | $-\pi/2$ to -0 | - 0 | NaN |
| | -0 | -p | -p | -p [*] | -0^* | -0 | -0 | NaN |
| | $+0$ | +p | + p | $+\pi^*$ | $+0^*$ | $+0$ | $+0$ | NaN |
| | $+F$ | +p | $+\pi$ to $+\pi/2$ | $+\pi/2$ | $+\pi/2$ | $+\pi/2$ to $+0$ | $+0$ | NaN |
| | $+\infty$ | $+3\pi/4^*$ | $+\pi/2$ | $+\pi/2$ | $+\pi/2$ | $+\pi/2$ | $+\pi/4^*$ | NaN |
| | NaN | NaN | NaN | NaN | NaN | NaN | NaN | NaN |

NOTES:

F Means finite floating-point value.

* Table 8-10 in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1, specifies that the ratios 0/0 and ∞/∞ generate the floating-point invalid arithmetic-operation exception and, if this exception is masked, the floating-point QNaN indefinite value is returned. With the FPATAN instruction, the 0/0 or ∞/∞ value is actually not calculated using division. Instead, the arctangent of the two variables is derived from a standard mathematical formulation that is generalized to allow complex numbers as arguments. In this complex variable formulation, $\arctan(0,0)$ etc. has well defined values. These values are needed to develop a library to compute transcendental functions with complex arguments, based on the FPU functions that only allow floating-point values as arguments.

There is no restriction on the range of source operands that FPATAN can accept.

This instruction’s operation is the same in non-64-bit modes and 64-bit mode.

IA-32 Architecture Compatibility

The source operands for this instruction are restricted for the 80287 math coprocessor to the following range:

$$0 \leq |\text{ST}(1)| < |\text{ST}(0)| < +\infty$$

Operation

$ST(1) := \arctan(ST(1) / ST(0));$
PopRegisterStack;

FPU Flags Affected

C1 Set to 0 if stack underflow occurred.
 Set if result was rounded up; cleared otherwise.
C0, C2, C3 Undefined.

Floating-Point Exceptions

#IS Stack underflow occurred.
#IA Source operand is an SNaN value or unsupported format.
#D Source operand is a denormal value.
#U Result is too small for destination format.
#P Value cannot be represented exactly in destination format.

Protected Mode Exceptions

#NM CR0.EM[bit 2] or CR0.TS[bit 3] = 1.
#MF If there is a pending x87 FPU exception.
#UD If the LOCK prefix is used.

Real-Address Mode Exceptions

FPREM—Partial Remainder

| Opcode | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|--------|-------------|-------------|------------------|---|
| D9 F8 | FPREM | Valid | Valid | Replace ST(0) with the remainder obtained from dividing ST(0) by ST(1). |

Description

Computes the remainder obtained from dividing the value in the ST(0) register (the dividend) by the value in the ST(1) register (the divisor or **modulus**), and stores the result in ST(0). The remainder represents the following value:

$$\text{Remainder} := \text{ST}(0) - (Q * \text{ST}(1))$$

Here, Q is an integer value that is obtained by truncating the floating-point number quotient of $[\text{ST}(0) / \text{ST}(1)]$ toward zero. The sign of the remainder is the same as the sign of the dividend. The magnitude of the remainder is less than that of the modulus, unless a partial remainder was computed (as described below).

This instruction produces an exact result; the inexact-result exception does not occur and the rounding control has no effect. The following table shows the results obtained when computing the remainder of various classes of numbers, assuming that underflow does not occur.

Table 3-40. FPREM Results

| | | ST(1) | | | | | | |
|-------|-----------|-----------|----------|-----|-----|----------|-----------|-----|
| ST(0) | | $-\infty$ | -F | -0 | +0 | +F | $+\infty$ | NaN |
| | $-\infty$ | * | * | * | * | * | * | NaN |
| | -F | ST(0) | -F or -0 | * | * | -F or -0 | ST(0) | NaN |
| | -0 | -0 | -0 | * | * | -0 | -0 | NaN |
| | +0 | +0 | +0 | * | * | +0 | +0 | NaN |
| | +F | ST(0) | +F or +0 | * | * | +F or +0 | ST(0) | NaN |
| | $+\infty$ | * | * | * | * | * | * | NaN |
| | NaN | NaN | NaN | NaN | NaN | NaN | NaN | NaN |

NOTES:

F Means finite floating-point value.

* Indicates floating-point invalid-arithmetic-operand (#IA) exception.

When the result is 0, its sign is the same as that of the dividend. When the modulus is ∞ , the result is equal to the value in ST(0).

The FPREM instruction does not compute the remainder specified in IEEE Std 754. The IEEE specified remainder can be computed with the FPREM1 instruction. The FPREM instruction is provided for compatibility with the Intel 8087 and Intel287 math coprocessors.

The FPREM instruction gets its name “partial remainder” because of the way it computes the remainder. This instruction arrives at a remainder through iterative subtraction. It can, however, reduce the exponent of ST(0) by no more than 63 in one execution of the instruction. If the instruction succeeds in producing a remainder that is less than the modulus, the operation is complete and the C2 flag in the FPU status word is cleared. Otherwise, C2 is set, and the result in ST(0) is called the **partial remainder**. The exponent of the partial remainder will be less than the exponent of the original dividend by at least 32. Software can re-execute the instruction (using the partial remainder in ST(0) as the dividend) until C2 is cleared. (Note that while executing such a remainder-computation loop, a higher-priority interrupting routine that needs the FPU can force a context switch in-between the instructions in the loop.)

An important use of the FPREM instruction is to reduce the arguments of periodic functions. When reduction is complete, the instruction stores the three least-significant bits of the quotient in the C3, C1, and C0 flags of the FPU

status word. This information is important in argument reduction for the tangent function (using a modulus of $\pi/4$), because it locates the original angle in the correct one of eight sectors of the unit circle.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

```
D := exponent(ST(0)) - exponent(ST(1));
IF D < 64
    THEN
        Q := Integer(TruncateTowardZero(ST(0) / ST(1)));
        ST(0) := ST(0) - (ST(1) * Q);
        C2 := 0;
        C0, C3, C1 := LeastSignificantBits(Q); (* Q2, Q1, Q0 *)
    ELSE
        C2 := 1;
        N := An implementation-dependent number between 32 and 63;
        QQ := Integer(TruncateTowardZero((ST(0) / ST(1)) / 2(D-N)));
        ST(0) := ST(0) - (ST(1) * QQ * 2(D-N));
FI;
```

FPU Flags Affected

| | |
|----|---|
| C0 | Set to bit 2 (Q2) of the quotient. |
| C1 | Set to 0 if stack underflow occurred; otherwise, set to least significant bit of quotient (Q0). |
| C2 | Set to 0 if reduction complete; set to 1 if incomplete. |
| C3 | Set to bit 1 (Q1) of the quotient. |

Floating-Point Exceptions

| | |
|-----|--|
| #IS | Stack underflow occurred. |
| #IA | Source operand is an SNaN value, modulus is 0, dividend is ∞ , or unsupported format. |
| #D | Source operand is a denormal value. |
| #U | Result is too small for destination format. |

Protected Mode Exceptions

| | |
|-----|--|
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

FPREM1—Partial Remainder

| Opcode | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|--------|-------------|-------------|------------------|--|
| D9 F5 | FPREM1 | Valid | Valid | Replace ST(0) with the IEEE remainder obtained from dividing ST(0) by ST(1). |

Description

Computes the IEEE remainder obtained from dividing the value in the ST(0) register (the dividend) by the value in the ST(1) register (the divisor or **modulus**), and stores the result in ST(0). The remainder represents the following value:

$$\text{Remainder} := \text{ST}(0) - (Q * \text{ST}(1))$$

Here, Q is an integer value that is obtained by rounding the floating-point number quotient of $[\text{ST}(0) / \text{ST}(1)]$ toward the nearest integer value. The magnitude of the remainder is less than or equal to half the magnitude of the modulus, unless a partial remainder was computed (as described below).

This instruction produces an exact result; the precision (inexact) exception does not occur and the rounding control has no effect. The following table shows the results obtained when computing the remainder of various classes of numbers, assuming that underflow does not occur.

Table 3-41. FPREM1 Results

| | | ST(1) | | | | | | |
|-------|-----------|-----------|-----------------|------|------|-----------------|-----------|-----|
| ST(0) | | $-\infty$ | $-F$ | -0 | $+0$ | $+F$ | $+\infty$ | NaN |
| | $-\infty$ | * | * | * | * | * | * | NaN |
| | $-F$ | ST(0) | $\pm F$ or -0 | * | * | $\pm F$ or -0 | ST(0) | NaN |
| | -0 | -0 | -0 | * | * | -0 | -0 | NaN |
| | $+0$ | $+0$ | $+0$ | * | * | $+0$ | $+0$ | NaN |

| | $+\infty$ | * | * | * | * | * | * | NaN |
| | NaN | NaN | NaN | NaN | NaN | NaN | NaN | NaN |

NOTES:

F Means finite floating-point value.

* Indicates floating-point invalid-arithmetic-operand (#IA) exception.

When the result is 0, its sign is the same as that of the dividend. When the modulus is ∞ , the result is equal to the value in ST(0).

The FPREM1 instruction computes the remainder specified in IEEE Standard 754. This instruction operates differently from the FPREM instruction in the way that it rounds the quotient of ST(0) divided by ST(1) to an integer (see the "Operation" section below).

Like the FPREM instruction, FPREM1 computes the remainder through iterative subtraction, but can reduce the exponent of ST(0) by no more than 63 in one execution of the instruction. If the instruction succeeds in producing a remainder that is less than one half the modulus, the operation is complete and the C2 flag in the FPU status word is cleared. Otherwise, C2 is set, and the result in ST(0) is called the **partial remainder**. The exponent of the partial remainder will be less than the exponent of the original dividend by at least 32. Software can re-execute the instruction (using the partial remainder in ST(0) as the dividend) until C2 is cleared. (Note that while executing such a remainder-computation loop, a higher-priority interrupting routine that needs the FPU can force a context switch in-between the instructions in the loop.)

An important use of the FPREM1 instruction is to reduce the arguments of periodic functions. When reduction is complete, the instruction stores the three least-significant bits of the quotient in the C3, C1, and C0 flags of the FPU status word. This information is important in argument reduction for the tangent function (using a modulus of $\pi/4$), because it locates the original angle in the correct one of eight sectors of the unit circle.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

```
D := exponent(ST(0)) - exponent(ST(1));
IF D < 64
    THEN
        Q := Integer(RoundTowardNearestInteger(ST(0) / ST(1)));
        ST(0) := ST(0) - (ST(1) * Q);
        C2 := 0;
        C0, C3, C1 := LeastSignificantBits(Q); (* Q2, Q1, Q0 *)
    ELSE
        C2 := 1;
        N := An implementation-dependent number between 32 and 63;
        QQ := Integer(TruncateTowardZero((ST(0) / ST(1)) / 2(D-N)));
        ST(0) := ST(0) - (ST(1) * QQ * 2(D-N));
FI;
```

FPU Flags Affected

| | |
|----|---|
| C0 | Set to bit 2 (Q2) of the quotient. |
| C1 | Set to 0 if stack underflow occurred; otherwise, set to least significant bit of quotient (Q0). |
| C2 | Set to 0 if reduction complete; set to 1 if incomplete. |
| C3 | Set to bit 1 (Q1) of the quotient. |

Floating-Point Exceptions

| | |
|-----|--|
| #IS | Stack underflow occurred. |
| #IA | Source operand is an SNaN value, modulus (divisor) is 0, dividend is ∞ , or unsupported format. |
| #D | Source operand is a denormal value. |
| #U | Result is too small for destination format. |

Protected Mode Exceptions

| | |
|-----|--|
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #UD | If the LOCK prefix is used. |

FPTAN—Partial Tangent

| Opcode | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|--------|-------------|-------------|------------------|---|
| D9 F2 | FPTAN | Valid | Valid | Replace ST(0) with its approximate tangent and push 1 onto the FPU stack. |

Description

Computes the approximate tangent of the source operand in register ST(0), stores the result in ST(0), and pushes a 1.0 onto the FPU register stack. The source operand must be given in radians and must be less than $\pm 2^{63}$. The following table shows the unmasked results obtained when computing the partial tangent of various classes of numbers, assuming that underflow does not occur.

Table 3-42. FPTAN Results

| ST(0) SRC | ST(0) DEST |
|-----------|--------------|
| $-\infty$ | * |
| $-F$ | $-F$ to $+F$ |
| -0 | -0 |
| $+0$ | $+0$ |
| $+F$ | $-F$ to $+F$ |
| $+\infty$ | * |
| NaN | NaN |

NOTES:

F Means finite floating-point value.

* Indicates floating-point invalid-arithmetic-operand (#IA) exception.

If the source operand is outside the acceptable range, the C2 flag in the FPU status word is set, and the value in register ST(0) remains unchanged. The instruction does not raise an exception when the source operand is out of range. It is up to the program to check the C2 flag for out-of-range conditions. Source values outside the range -2^{63} to $+2^{63}$ can be reduced to the range of the instruction by subtracting an appropriate integer multiple of 2π . However, even within the range -2^{63} to $+2^{63}$, inaccurate results can occur because the finite approximation of π used internally for argument reduction is not sufficient in all cases. Therefore, for accurate results it is safe to apply FPTAN only to arguments reduced accurately in software, to a value smaller in absolute value than $3\pi/8$. See the sections titled "Approximation of Pi" and "Transcendental Instruction Accuracy" in Chapter 8 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, for a discussion of the proper value to use for π in performing such reductions.

The value 1.0 is pushed onto the register stack after the tangent has been computed to maintain compatibility with the Intel 8087 and Intel287 math coprocessors. This operation also simplifies the calculation of other trigonometric functions. For instance, the cotangent (which is the reciprocal of the tangent) can be computed by executing a FDIVR instruction after the FPTAN instruction.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

```
IF ST(0) < 263
  THEN
    C2 := 0;
    ST(0) := fptan(ST(0)); // approximation of tan
    TOP := TOP - 1;
    ST(0) := 1.0;
  ELSE (* Source operand is out-of-range *)
    C2 := 1;
FI;
```

FPU Flags Affected

| | |
|--------|--|
| C1 | Set to 0 if stack underflow occurred; set to 1 if stack overflow occurred. Set if result was rounded up; cleared otherwise. |
| C2 | Set to 1 if outside range ($-2^{63} < \text{source operand} < +2^{63}$); otherwise, set to 0. |
| C0, C3 | Undefined. |

Floating-Point Exceptions

| | |
|-----|--|
| #IS | Stack underflow or overflow occurred. |
| #IA | Source operand is an SNaN value, ∞ , or unsupported format. |
| #D | Source operand is a denormal value. |
| #U | Result is too small for destination format. |
| #P | Value cannot be represented exactly in destination format. |

Protected Mode Exceptions

| | |
|-----|--|
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #UD | If the LOCK prefix is used. |

FRNDINT—Round to Integer

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------------|-----------------|----------------------------|
| D9 FC | FRNDINT | Valid | Valid | Round ST(0) to an integer. |

Description

Rounds the source value in the ST(0) register to the nearest integral value, depending on the current rounding mode (setting of the RC field of the FPU control word), and stores the result in ST(0).

If the source value is ∞ , the value is not changed. If the source value is not an integral value, the floating-point inexact-result exception (#P) is generated.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

ST(0) := RoundToIntegralValue(ST(0));

FPU Flags Affected

| | |
|------------|--|
| C1 | Set to 0 if stack underflow occurred. |
| | Set if result was rounded up; cleared otherwise. |
| C0, C2, C3 | Undefined. |

Floating-Point Exceptions

| | |
|-----|--|
| #IS | Stack underflow occurred. |
| #IA | Source operand is an SNaN value or unsupported format. |
| #D | Source operand is a denormal value. |
| #P | Source operand is not an integral value. |

Protected Mode Exceptions

| | |
|-----|--|
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #UD | If the LOCK prefix is used. |

FRSTOR—Restore x87 FPU State

| Opcode | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|--------|--------------------|-------------|------------------|--|
| DD /4 | FRSTOR m94/108byte | Valid | Valid | Load FPU state from m94byte or m108byte. |

Description

Loads the FPU state (operating environment and register stack) from the memory area specified with the source operand. This state data is typically written to the specified memory location by a previous FSAVE/FNSAVE instruction.

The FPU operating environment consists of the FPU control word, status word, tag word, instruction pointer, data pointer, and last opcode. Figures 8-9 through 8-12 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, show the layout in memory of the stored environment, depending on the operating mode of the processor (protected or real) and the current operand-size attribute (16-bit or 32-bit). In virtual-8086 mode, the real mode layouts are used. The contents of the FPU register stack are stored in the 80 bytes immediately following the operating environment image.

The FRSTOR instruction should be executed in the same operating mode as the corresponding FSAVE/FNSAVE instruction.

If one or more unmasked exception bits are set in the new FPU status word, a floating-point exception will be generated upon execution of the next floating-point instruction (except for the no-wait floating-point instructions, see the section titled "Software Exception Handling" in Chapter 8 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1). To avoid raising exceptions when loading a new operating environment, clear all the exception flags in the FPU status word that is being loaded.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

```
FPUControlWord := SRC[FPUControlWord];
FPUStatusWord := SRC[FPUStatusWord];
FPUTagWord := SRC[FPUTagWord];
FPUDataPointer := SRC[FPUDataPointer];
FPUInstructionPointer := SRC[FPUInstructionPointer];
FPULastInstructionOpcode := SRC[FPULastInstructionOpcode];

ST(0) := SRC[ST(0)];
ST(1) := SRC[ST(1)];
ST(2) := SRC[ST(2)];
ST(3) := SRC[ST(3)];
ST(4) := SRC[ST(4)];
ST(5) := SRC[ST(5)];
ST(6) := SRC[ST(6)];
ST(7) := SRC[ST(7)];
```

FPU Flags Affected

The C0, C1, C2, C3 flags are loaded.

Floating-Point Exceptions

None; however, if an unmasked exception is loaded in the status word, it is generated upon execution of the next "waiting" floating-point instruction.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register is used to access memory and it contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

FSAVE/FNSAVE—Store x87 FPU State

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|----------|---------------------------------|-------------|-----------------|---|
| 9B DD /6 | FSAVE m94/108byte | Valid | Valid | Store FPU state to m94byte or m108byte after checking for pending unmasked floating-point exceptions. Then re-initialize the FPU. |
| DD /6 | FNSAVE ¹ m94/108byte | Valid | Valid | Store FPU environment to m94byte or m108byte without checking for pending unmasked floating-point exceptions. Then re-initialize the FPU. |

NOTES:

1. See IA-32 Architecture Compatibility section below.

Description

Stores the current FPU state (operating environment and register stack) at the specified destination in memory, and then re-initializes the FPU. The FSAVE instruction checks for and handles pending unmasked floating-point exceptions before storing the FPU state; the FNSAVE instruction does not.

The FPU operating environment consists of the FPU control word, status word, tag word, instruction pointer, data pointer, and last opcode. Figures 8-9 through 8-12 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, show the layout in memory of the stored environment, depending on the operating mode of the processor (protected or real) and the current operand-size attribute (16-bit or 32-bit). In virtual-8086 mode, the real mode layouts are used. The contents of the FPU register stack are stored in the 80 bytes immediately follow the operating environment image.

The saved image reflects the state of the FPU after all floating-point instructions preceding the FSAVE/FNSAVE instruction in the instruction stream have been executed.

After the FPU state has been saved, the FPU is reset to the same default values it is set to with the FINIT/FNINIT instructions (see "FINIT/FNINIT—Initialize Floating-Point Unit" in this chapter).

The FSAVE/FNSAVE instructions are typically used when the operating system needs to perform a context switch, an exception handler needs to use the FPU, or an application program needs to pass a "clean" FPU to a procedure.

The assembler issues two instructions for the FSAVE instruction (an FWAIT instruction followed by an FNSAVE instruction), and the processor executes each of these instructions separately. If an exception is generated for either of these instructions, the save EIP points to the instruction that caused the exception.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

IA-32 Architecture Compatibility

For Intel math coprocessors and FPU's prior to the Intel Pentium processor, an FWAIT instruction should be executed before attempting to read from the memory image stored with a prior FSAVE/FNSAVE instruction. This FWAIT instruction helps ensure that the storage operation has been completed.

When operating a Pentium or Intel486 processor in MS-DOS compatibility mode, it is possible (under unusual circumstances) for an FNSAVE instruction to be interrupted prior to being executed to handle a pending FPU exception. See the section titled "No-Wait FPU Instructions Can Get FPU Interrupt in Window" in Appendix D of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, for a description of these circumstances. An FNSAVE instruction cannot be interrupted in this way on later Intel processors, except for the Intel Quark™ X1000 processor.

Operation

(* Save FPU State and Registers *)

```
DEST[FPUControlWord] := FPUControlWord;  
DEST[FPUStatusWord] := FPUStatusWord;  
DEST[FPUTagWord] := FPUTagWord;  
DEST[FPUDataPointer] := FPUDataPointer;  
DEST[FPUInstructionPointer] := FPUInstructionPointer;  
DEST[FPULastInstructionOpcode] := FPULastInstructionOpcode;
```

```
DEST[ST(0)] := ST(0);  
DEST[ST(1)] := ST(1);  
DEST[ST(2)] := ST(2);  
DEST[ST(3)] := ST(3);  
DEST[ST(4)] := ST(4);  
DEST[ST(5)] := ST(5);  
DEST[ST(6)] := ST(6);  
DEST[ST(7)] := ST(7);
```

(* Initialize FPU *)

```
FPUControlWord := 037FH;  
FPUStatusWord := 0;  
FPUTagWord := FFFFH;  
FPUDataPointer := 0;  
FPUInstructionPointer := 0;  
FPULastInstructionOpcode := 0;
```

FPU Flags Affected

The C0, C1, and C2 flags are saved and then cleared.

Floating-Point Exceptions

None.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If destination is located in a non-writable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register is used to access memory and it contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |

FSCALE—Scale

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------------|-----------------|-----------------------|
| D9 FD | FSCALE | Valid | Valid | Scale ST(0) by ST(1). |

Description

Truncates the value in the source operand (toward 0) to an integral value and adds that value to the exponent of the destination operand. The destination and source operands are floating-point values located in registers ST(0) and ST(1), respectively. This instruction provides rapid multiplication or division by integral powers of 2. The following table shows the results obtained when scaling various classes of numbers, assuming that neither overflow nor underflow occurs.

Table 3-43. FSCALE Results

| ST(0) | ST(1) | | | | | | | |
|-------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----|
| | | $-\infty$ | $-F$ | -0 | $+0$ | $+F$ | $+\infty$ | NaN |
| | $-\infty$ | NaN | $-\infty$ | $-\infty$ | $-\infty$ | $-\infty$ | $-\infty$ | NaN |
| | $-F$ | -0 | $-F$ | $-F$ | $-F$ | $-F$ | $-\infty$ | NaN |
| | -0 | -0 | -0 | -0 | -0 | -0 | NaN | NaN |
| | $+0$ | $+0$ | $+0$ | $+0$ | $+0$ | $+0$ | NaN | NaN |
| | $+F$ | $+0$ | $+F$ | $+F$ | $+F$ | $+F$ | $+\infty$ | NaN |
| | $+\infty$ | NaN | $+\infty$ | $+\infty$ | $+\infty$ | $+\infty$ | $+\infty$ | NaN |
| | NaN | NaN | NaN | NaN | NaN | NaN | NaN | NaN |

NOTES:

F Means finite floating-point value.

In most cases, only the exponent is changed and the mantissa (significand) remains unchanged. However, when the value being scaled in ST(0) is a denormal value, the mantissa is also changed and the result may turn out to be a normalized number. Similarly, if overflow or underflow results from a scale operation, the resulting mantissa will differ from the source's mantissa.

The FSCALE instruction can also be used to reverse the action of the FXTRACT instruction, as shown in the following example:

```
FXTRACT;
FSCALE;
FSTP ST(1);
```

In this example, the FXTRACT instruction extracts the significand and exponent from the value in ST(0) and stores them in ST(0) and ST(1) respectively. The FSCALE then scales the significand in ST(0) by the exponent in ST(1), recreating the original value before the FXTRACT operation was performed. The FSTP ST(1) instruction overwrites the exponent (extracted by the FXTRACT instruction) with the recreated value, which returns the stack to its original state with only one register [ST(0)] occupied.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

$$ST(0) := ST(0) * 2^{\text{RoundTowardZero}(ST(1))},$$

FPU Flags Affected

| | |
|------------|---|
| C1 | Set to 0 if stack underflow occurred. Set if result was rounded up; cleared otherwise. |
| C0, C2, C3 | Undefined. |

Floating-Point Exceptions

| | |
|-----|--|
| #IS | Stack underflow occurred. |
| #IA | Source operand is an SNaN value or unsupported format. |
| #D | Source operand is a denormal value. |
| #U | Result is too small for destination format. |
| #O | Result is too large for destination format. |
| #P | Value cannot be represented exactly in destination format. |

Protected Mode Exceptions

| | |
|-----|--|
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #UD | If the LOCK prefix is used. |

FSIN—Sine

| Opcode | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|--------|-------------|-------------|------------------|---|
| D9 FE | FSIN | Valid | Valid | Replace ST(0) with the approximate of its sine. |

Description

Computes an approximation of the sine of the source operand in register ST(0) and stores the result in ST(0). The source operand must be given in radians and must be within the range -2^{63} to $+2^{63}$. The following table shows the results obtained when taking the sine of various classes of numbers, assuming that underflow does not occur.

Table 3-44. FSIN Results

| SRC (ST(0)) | DEST (ST(0)) |
|-------------|--------------|
| $-\infty$ | * |
| $-F$ | -1 to $+1$ |
| -0 | -0 |
| $+0$ | $+0$ |
| $+F$ | -1 to $+1$ |
| $+\infty$ | * |
| NaN | NaN |

NOTES:

F Means finite floating-point value.

* Indicates floating-point invalid-arithmetic-operand (#IA) exception.

If the source operand is outside the acceptable range, the C2 flag in the FPU status word is set, and the value in register ST(0) remains unchanged. The instruction does not raise an exception when the source operand is out of range. It is up to the program to check the C2 flag for out-of-range conditions. Source values outside the range -2^{63} to $+2^{63}$ can be reduced to the range of the instruction by subtracting an appropriate integer multiple of 2π . However, even within the range -2^{63} to $+2^{63}$, inaccurate results can occur because the finite approximation of π used internally for argument reduction is not sufficient in all cases. Therefore, for accurate results it is safe to apply FSIN only to arguments reduced accurately in software, to a value smaller in absolute value than $3\pi/4$. See the sections titled "Approximation of Pi" and "Transcendental Instruction Accuracy" in Chapter 8 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, for a discussion of the proper value to use for π in performing such reductions.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

```
IF  $-2^{63} < \text{ST}(0) < 2^{63}$ 
  THEN
    C2 := 0;
    ST(0) := fsin(ST(0)); // approximation of the mathematical sin function
  ELSE (* Source operand out of range *)
    C2 := 1;
FI;
```

FPU Flags Affected

| | |
|--------|---|
| C1 | Set to 0 if stack underflow occurred. Set if result was rounded up; cleared otherwise. |
| C2 | Set to 1 if outside range ($-2^{63} < \text{source operand} < +2^{63}$); otherwise, set to 0. |
| C0, C3 | Undefined. |

Floating-Point Exceptions

| | |
|-----|--|
| #IS | Stack underflow occurred. |
| #IA | Source operand is an SNaN value, ∞ , or unsupported format. |
| #D | Source operand is a denormal value. |
| #P | Value cannot be represented exactly in destination format. |

Protected Mode Exceptions

| | |
|-----|--|
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #UD | If the LOCK prefix is used. |

FSINCOS—Sine and Cosine

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------------|-----------------|---|
| D9 FB | FSINCOS | Valid | Valid | Compute the sine and cosine of ST(0); replace ST(0) with the approximate sine, and push the approximate cosine onto the register stack. |

Description

Computes both the approximate sine and the cosine of the source operand in register ST(0), stores the sine in ST(0), and pushes the cosine onto the top of the FPU register stack. (This instruction is faster than executing the FSIN and FCOS instructions in succession.)

The source operand must be given in radians and must be within the range -2^{63} to $+2^{63}$. The following table shows the results obtained when taking the sine and cosine of various classes of numbers, assuming that underflow does not occur.

Table 3-45. FSINCOS Results

| SRC | DEST | |
|-----------|--------------|--------------|
| ST(0) | ST(1) Cosine | ST(0) Sine |
| $-\infty$ | * | * |
| $-F$ | -1 to $+1$ | -1 to $+1$ |
| -0 | $+1$ | -0 |
| $+0$ | $+1$ | $+0$ |
| $+F$ | -1 to $+1$ | -1 to $+1$ |
| $+\infty$ | * | * |
| NaN | NaN | NaN |

NOTES:

F Means finite floating-point value.

* Indicates floating-point invalid-arithmetic-operand (#IA) exception.

If the source operand is outside the acceptable range, the C2 flag in the FPU status word is set, and the value in register ST(0) remains unchanged. The instruction does not raise an exception when the source operand is out of range. It is up to the program to check the C2 flag for out-of-range conditions. Source values outside the range -2^{63} to $+2^{63}$ can be reduced to the range of the instruction by subtracting an appropriate integer multiple of 2π . However, even within the range -2^{63} to $+2^{63}$, inaccurate results can occur because the finite approximation of π used internally for argument reduction is not sufficient in all cases. Therefore, for accurate results it is safe to apply FSINCOS only to arguments reduced accurately in software, to a value smaller in absolute value than $3\pi/8$. See the sections titled "Approximation of Pi" and "Transcendental Instruction Accuracy" in Chapter 8 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, for a discussion of the proper value to use for π in performing such reductions.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

```
IF ST(0) < 263
    THEN
        C2 := 0;
        TEMP := fcos(ST(0)); // approximation of cosine
        ST(0) := fsin(ST(0)); // approximation of sine
        TOP := TOP - 1;
        ST(0) := TEMP;
    ELSE (* Source operand out of range *)
        C2 := 1;
FI;
```

FPU Flags Affected

| | |
|--------|--|
| C1 | Set to 0 if stack underflow occurred; set to 1 if stack overflow occurs. Set if result was rounded up; cleared otherwise. |
| C2 | Set to 1 if outside range ($-2^{63} < \text{source operand} < +2^{63}$); otherwise, set to 0. |
| C0, C3 | Undefined. |

Floating-Point Exceptions

| | |
|-----|--|
| #IS | Stack underflow or overflow occurred. |
| #IA | Source operand is an SNaN value, ∞ , or unsupported format. |
| #D | Source operand is a denormal value. |
| #U | Result is too small for destination format. |
| #P | Value cannot be represented exactly in destination format. |

Protected Mode Exceptions

| | |
|-----|--|
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #UD | If the LOCK prefix is used. |

FSQRT—Square Root

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------------|-----------------|---|
| D9 FA | FSQRT | Valid | Valid | Computes square root of ST(0) and stores the result in ST(0). |

Description

Computes the square root of the source value in the ST(0) register and stores the result in ST(0).

The following table shows the results obtained when taking the square root of various classes of numbers, assuming that neither overflow nor underflow occurs.

Table 3-46. FSQRT Results

| SRC (ST(0)) | DEST (ST(0)) |
|-------------|--------------|
| $-\infty$ | * |
| $-F$ | * |
| -0 | -0 |
| $+0$ | $+0$ |
| $+F$ | $+F$ |
| $+\infty$ | $+\infty$ |
| NaN | NaN |

NOTES:

F Means finite floating-point value.

* Indicates floating-point invalid-arithmetic-operand (#IA) exception.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

ST(0) := SquareRoot(ST(0));

FPU Flags Affected

| | |
|------------|---|
| C1 | Set to 0 if stack underflow occurred. Set if result was rounded up; cleared otherwise. |
| C0, C2, C3 | Undefined. |

Floating-Point Exceptions

| | |
|-----|--|
| #IS | Stack underflow occurred. |
| #IA | Source operand is an SNaN value or unsupported format. Source operand is a negative value (except for -0). |
| #D | Source operand is a denormal value. |
| #P | Value cannot be represented exactly in destination format. |

Protected Mode Exceptions

| | |
|-----|--|
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |

FST/FSTP—Store Floating-Point Value

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|---------|-------------|-------------|-----------------|---|
| D9 /2 | FST m32fp | Valid | Valid | Copy ST(0) to m32fp. |
| DD /2 | FST m64fp | Valid | Valid | Copy ST(0) to m64fp. |
| DD D0+i | FST ST(i) | Valid | Valid | Copy ST(0) to ST(i). |
| D9 /3 | FSTP m32fp | Valid | Valid | Copy ST(0) to m32fp and pop register stack. |
| DD /3 | FSTP m64fp | Valid | Valid | Copy ST(0) to m64fp and pop register stack. |
| DB /7 | FSTP m80fp | Valid | Valid | Copy ST(0) to m80fp and pop register stack. |
| DD D8+i | FSTP ST(i) | Valid | Valid | Copy ST(0) to ST(i) and pop register stack. |

Description

The FST instruction copies the value in the ST(0) register to the destination operand, which can be a memory location or another register in the FPU register stack. When storing the value in memory, the value is converted to single precision or double precision floating-point format.

The FSTP instruction performs the same operation as the FST instruction and then pops the register stack. To pop the register stack, the processor marks the ST(0) register as empty and increments the stack pointer (TOP) by 1. The FSTP instruction can also store values in memory in double extended-precision floating-point format.

If the destination operand is a memory location, the operand specifies the address where the first byte of the destination value is to be stored. If the destination operand is a register, the operand specifies a register in the register stack relative to the top of the stack.

If the destination size is single precision or double precision, the significand of the value being stored is rounded to the width of the destination (according to the rounding mode specified by the RC field of the FPU control word), and the exponent is converted to the width and bias of the destination format. If the value being stored is too large for the destination format, a numeric overflow exception (#O) is generated and, if the exception is unmasked, no value is stored in the destination operand. If the value being stored is a denormal value, the denormal exception (#D) is not generated. This condition is simply signaled as a numeric underflow exception (#U) condition.

If the value being stored is ± 0 , $\pm\infty$, or a NaN, the least-significant bits of the significand and the exponent are truncated to fit the destination format. This operation preserves the value's identity as a 0, ∞ , or NaN.

If the destination operand is a non-empty register, the invalid-operation exception is not generated.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

DEST := ST(0);

IF Instruction = FSTP

THEN

PopRegisterStack;

FI;

FPU Flags Affected

| | |
|------------|---|
| C1 | Set to 0 if stack underflow occurred. Indicates rounding direction of if the floating-point inexact exception (#P) is generated: 0 := not roundup; 1 := roundup. |
| C0, C2, C3 | Undefined. |

Floating-Point Exceptions

| | |
|-----|---|
| #IS | Stack underflow occurred. |
| #IA | If destination result is an SNaN value or unsupported format, except when the destination format is in double extended-precision floating-point format. |
| #U | Result is too small for the destination format. |
| #O | Result is too large for the destination format. |
| #P | Value cannot be represented exactly in destination format. |

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If the destination is located in a non-writable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register is used to access memory and it contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

FSTCW/FNSTCW—Store x87 FPU Control Word

| Opcode | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|----------|----------------------------|-------------|------------------|---|
| 9B D9 /7 | FSTCW m2byte | Valid | Valid | Store FPU control word to m2byte after checking for pending unmasked floating-point exceptions. |
| D9 /7 | FNSTCW ¹ m2byte | Valid | Valid | Store FPU control word to m2byte without checking for pending unmasked floating-point exceptions. |

NOTES:

1. See IA-32 Architecture Compatibility section below.

Description

Stores the current value of the FPU control word at the specified destination in memory. The FSTCW instruction checks for and handles pending unmasked floating-point exceptions before storing the control word; the FNSTCW instruction does not.

The assembler issues two instructions for the FSTCW instruction (an FWAIT instruction followed by an FNSTCW instruction), and the processor executes each of these instructions separately. If an exception is generated for either of these instructions, the save EIP points to the instruction that caused the exception.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

IA-32 Architecture Compatibility

When operating a Pentium or Intel486 processor in MS-DOS compatibility mode, it is possible (under unusual circumstances) for an FNSTCW instruction to be interrupted prior to being executed to handle a pending FPU exception. See the section titled "No-Wait FPU Instructions Can Get FPU Interrupt in Window" in Appendix D of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, for a description of these circumstances. An FNSTCW instruction cannot be interrupted in this way on later Intel processors, except for the Intel Quark™ X1000 processor.

Operation

DEST := FPUControlWord;

FPU Flags Affected

The C0, C1, C2, and C3 flags are undefined.

Floating-Point Exceptions

None.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If the destination is located in a non-writable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register is used to access memory and it contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

FSTENV/FNSTENV—Store x87 FPU Environment

| Opcode | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|----------|---------------------------------|-------------|------------------|---|
| 9B D9 /6 | FSTENV m14/28byte | Valid | Valid | Store FPU environment to m14byte or m28byte after checking for pending unmasked floating-point exceptions. Then mask all floating-point exceptions. |
| D9 /6 | FNSTENV ¹ m14/28byte | Valid | Valid | Store FPU environment to m14byte or m28byte without checking for pending unmasked floating-point exceptions. Then mask all floating-point exceptions. |

NOTES:

1. See IA-32 Architecture Compatibility section below.

Description

Saves the current FPU operating environment at the memory location specified with the destination operand, and then masks all floating-point exceptions. The FPU operating environment consists of the FPU control word, status word, tag word, instruction pointer, data pointer, and last opcode. Figures 8-9 through 8-12 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, show the layout in memory of the stored environment, depending on the operating mode of the processor (protected or real) and the current operand-size attribute (16-bit or 32-bit). In virtual-8086 mode, the real mode layouts are used.

The FSTENV instruction checks for and handles any pending unmasked floating-point exceptions before storing the FPU environment; the FNSTENV instruction does not. The saved image reflects the state of the FPU after all floating-point instructions preceding the FSTENV/FNSTENV instruction in the instruction stream have been executed.

These instructions are often used by exception handlers because they provide access to the FPU instruction and data pointers. The environment is typically saved in the stack. Masking all exceptions after saving the environment prevents floating-point exceptions from interrupting the exception handler.

The assembler issues two instructions for the FSTENV instruction (an FWAIT instruction followed by an FNSTENV instruction), and the processor executes each of these instructions separately. If an exception is generated for either of these instructions, the save EIP points to the instruction that caused the exception.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

IA-32 Architecture Compatibility

When operating a Pentium or Intel486 processor in MS-DOS compatibility mode, it is possible (under unusual circumstances) for an FNSTENV instruction to be interrupted prior to being executed to handle a pending FPU exception. See the section titled "No-Wait FPU Instructions Can Get FPU Interrupt in Window" in Appendix D of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, for a description of these circumstances. An FNSTENV instruction cannot be interrupted in this way on later Intel processors, except for the Intel Quark™ X1000 processor.

Operation

```
DEST[FPUControlWord] := FPUControlWord;  
DEST[FPUStatusWord] := FPUStatusWord;  
DEST[FPUTagWord] := FPUTagWord;  
DEST[FPUDataPointer] := FPUDataPointer;  
DEST[FPUInstructionPointer] := FPUInstructionPointer;  
DEST[FPULastInstructionOpcode] := FPULastInstructionOpcode;
```

FPU Flags Affected

The C0, C1, C2, and C3 are undefined.

Floating-Point Exceptions

None.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If the destination is located in a non-writable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register is used to access memory and it contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #PF(fault-code) | If a page fault occurs. |

| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

FSTSW/FNSTSW—Store x87 FPU Status Word

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|----------|----------------------------|-------------|-----------------|---|
| 9B DD /7 | FSTSW m2byte | Valid | Valid | Store FPU status word at m2byte after checking for pending unmasked floating-point exceptions. |
| 9B DF E0 | FSTSW AX | Valid | Valid | Store FPU status word in AX register after checking for pending unmasked floating-point exceptions. |
| DD /7 | FNSTSW ¹ m2byte | Valid | Valid | Store FPU status word at m2byte without checking for pending unmasked floating-point exceptions. |
| DF E0 | FNSTSW ¹ AX | Valid | Valid | Store FPU status word in AX register without checking for pending unmasked floating-point exceptions. |

NOTES:

1. See IA-32 Architecture Compatibility section below.

Description

Stores the current value of the x87 FPU status word in the destination location. The destination operand can be either a two-byte memory location or the AX register. The FSTSW instruction checks for and handles pending unmasked floating-point exceptions before storing the status word; the FNSTSW instruction does not.

The FNSTSW AX form of the instruction is used primarily in conditional branching (for instance, after an FPU comparison instruction or an FPREM, FPREM1, or FXAM instruction), where the direction of the branch depends on the state of the FPU condition code flags. (See the section titled “Branching and Conditional Moves on FPU Condition Codes” in Chapter 8 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1.) This instruction can also be used to invoke exception handlers (by examining the exception flags) in environments that do not use interrupts. When the FNSTSW AX instruction is executed, the AX register is updated before the processor executes any further instructions. The status stored in the AX register is thus guaranteed to be from the completion of the prior FPU instruction.

The assembler issues two instructions for the FSTSW instruction (an FWAIT instruction followed by an FNSTSW instruction), and the processor executes each of these instructions separately. If an exception is generated for either of these instructions, the save EIP points to the instruction that caused the exception.

This instruction’s operation is the same in non-64-bit modes and 64-bit mode.

IA-32 Architecture Compatibility

When operating a Pentium or Intel486 processor in MS-DOS compatibility mode, it is possible (under unusual circumstances) for an FNSTSW instruction to be interrupted prior to being executed to handle a pending FPU exception. See the section titled “No-Wait FPU Instructions Can Get FPU Interrupt in Window” in Appendix D of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1, for a description of these circumstances. An FNSTSW instruction cannot be interrupted in this way on later Intel processors, except for the Intel Quark™ X1000 processor.

Operation

DEST := FPUStatusWord;

FPU Flags Affected

The C0, C1, C2, and C3 are undefined.

Floating-Point Exceptions

None.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If the destination is located in a non-writable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register is used to access memory and it contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

FSUB/FSUBP/FISUB—Subtract

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|---------|--------------------|-------------|-----------------|---|
| D8 /4 | FSUB m32fp | Valid | Valid | Subtract m32fp from ST(0) and store result in ST(0). |
| DC /4 | FSUB m64fp | Valid | Valid | Subtract m64fp from ST(0) and store result in ST(0). |
| D8 E0+i | FSUB ST(0), ST(i) | Valid | Valid | Subtract ST(i) from ST(0) and store result in ST(0). |
| DC E8+i | FSUB ST(i), ST(0) | Valid | Valid | Subtract ST(0) from ST(i) and store result in ST(i). |
| DE E8+i | FSUBP ST(i), ST(0) | Valid | Valid | Subtract ST(0) from ST(i), store result in ST(i), and pop register stack. |
| DE E9 | FSUBP | Valid | Valid | Subtract ST(0) from ST(1), store result in ST(1), and pop register stack. |
| DA /4 | FISUB m32int | Valid | Valid | Subtract m32int from ST(0) and store result in ST(0). |
| DE /4 | FISUB m16int | Valid | Valid | Subtract m16int from ST(0) and store result in ST(0). |

Description

Subtracts the source operand from the destination operand and stores the difference in the destination location. The destination operand is always an FPU data register; the source operand can be a register or a memory location. Source operands in memory can be in single precision or double precision floating-point format or in word or doubleword integer format.

The no-operand version of the instruction subtracts the contents of the ST(0) register from the ST(1) register and stores the result in ST(1). The one-operand version subtracts the contents of a memory location (either a floating-point or an integer value) from the contents of the ST(0) register and stores the result in ST(0). The two-operand version, subtracts the contents of the ST(0) register from the ST(i) register or vice versa.

The FSUBP instructions perform the additional operation of popping the FPU register stack following the subtraction. To pop the register stack, the processor marks the ST(0) register as empty and increments the stack pointer (TOP) by 1. The no-operand version of the floating-point subtract instructions always results in the register stack being popped. In some assemblers, the mnemonic for this instruction is FSUB rather than FSUBP.

The FISUB instructions convert an integer source operand to double extended-precision floating-point format before performing the subtraction.

Table 3-47 shows the results obtained when subtracting various classes of numbers from one another, assuming that neither overflow nor underflow occurs. Here, the SRC value is subtracted from the DEST value (DEST – SRC = result).

When the difference between two operands of like sign is 0, the result is +0, except for the round toward $-\infty$ mode, in which case the result is -0 . This instruction also guarantees that $+0 - (-0) = +0$, and that $-0 - (+0) = -0$. When the source operand is an integer 0, it is treated as a +0.

When one operand is ∞ , the result is ∞ of the expected sign. If both operands are ∞ of the same sign, an invalid-operation exception is generated.

Table 3-47. FSUB/FSUBP/FISUB Results

| DEST | SRC | | | | | | | |
|------|-----------|-----------|--------------------|-----------|-----------|--------------------|-----------|-----|
| | | $-\infty$ | $-F$ or $-I$ | -0 | $+0$ | $+F$ or $+I$ | $+\infty$ | NaN |
| | $-\infty$ | * | $-\infty$ | $-\infty$ | $-\infty$ | $-\infty$ | $-\infty$ | NaN |
| | $-F$ | $+\infty$ | $\pm F$ or ± 0 | DEST | DEST | $-F$ | $-\infty$ | NaN |
| | -0 | $+\infty$ | $-SRC$ | ± 0 | -0 | $-SRC$ | $-\infty$ | NaN |
| | $+0$ | $+\infty$ | $-SRC$ | $+0$ | ± 0 | $-SRC$ | $-\infty$ | NaN |
| | $+F$ | $+\infty$ | $+F$ | DEST | DEST | $\pm F$ or ± 0 | $-\infty$ | NaN |
| | $+\infty$ | $+\infty$ | $+\infty$ | $+\infty$ | $+\infty$ | $+\infty$ | * | NaN |
| | NaN | NaN | NaN | NaN | NaN | NaN | NaN | NaN |

NOTES:

F Means finite floating-point value.

I Means integer.

* Indicates floating-point invalid-arithmetic-operand (#IA) exception.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

IF Instruction = FISUB

THEN

DEST := DEST – ConvertToDoubleExtendedPrecisionFP(SRC);

ELSE (* Source operand is floating-point value *)

DEST := DEST – SRC;

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #NM | CR0.EM[bit 2] or CR0.TS[bit 3] = 1. |
| #MF | If there is a pending x87 FPU exception. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

FSUBR/FSUBRP/FISUBR—Reverse Subtract

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|---------|---------------------|-------------|-----------------|---|
| D8 /5 | FSUBR m32fp | Valid | Valid | Subtract ST(0) from m32fp and store result in ST(0). |
| DC /5 | FSUBR m64fp | Valid | Valid | Subtract ST(0) from m64fp and store result in ST(0). |
| D8 E8+i | FSUBR ST(0), ST(i) | Valid | Valid | Subtract ST(0) from ST(i) and store result in ST(0). |
| DC E0+i | FSUBR ST(i), ST(0) | Valid | Valid | Subtract ST(i) from ST(0) and store result in ST(i). |
| DE E0+i | FSUBRP ST(i), ST(0) | Valid | Valid | Subtract ST(i) from ST(0), store result in ST(i), and pop register stack. |
| DE E1 | FSUBRP | Valid | Valid | Subtract ST(1) from ST(0), store result in ST(1), and pop register stack. |
| DA /5 | FISUBR m32int | Valid | Valid | Subtract ST(0) from m32int and store result in ST(0). |
| DE /5 | FISUBR m16int | Valid | Valid | Subtract ST(0) from m16int and store result in ST(0). |

Description

Subtracts the destination operand from the source operand and stores the difference in the destination location. The destination operand is always an FPU register; the source operand can be a register or a memory location. Source operands in memory can be in single precision or double precision floating-point format or in word or doubleword integer format.

These instructions perform the reverse operations of the FSUB, FSUBP, and FISUB instructions. They are provided to support more efficient coding.

The no-operand version of the instruction subtracts the contents of the ST(1) register from the ST(0) register and stores the result in ST(1). The one-operand version subtracts the contents of the ST(0) register from the contents of a memory location (either a floating-point or an integer value) and stores the result in ST(0). The two-operand version, subtracts the contents of the ST(i) register from the ST(0) register or vice versa.

The FSUBRP instructions perform the additional operation of popping the FPU register stack following the subtraction. To pop the register stack, the processor marks the ST(0) register as empty and increments the stack pointer (TOP) by 1. The no-operand version of the floating-point reverse subtract instructions always results in the register stack being popped. In some assemblers, the mnemonic for this instruction is FSUBR rather than FSUBRP.

The FISUBR instructions convert an integer source operand to double extended-precision floating-point format before performing the subtraction.

The following table shows the results obtained when subtracting various classes of numbers from one another, assuming that neither overflow nor underflow occurs. Here, the DEST value is subtracted from the SRC value ($SRC - DEST = \text{result}$).

When the difference between two operands of like sign is 0, the result is +0, except for the round toward $-\infty$ mode, in which case the result is -0 . This instruction also guarantees that $+0 - (-0) = +0$, and that $-0 - (+0) = -0$. When the source operand is an integer 0, it is treated as a +0.

When one operand is ∞ , the result is ∞ of the expected sign. If both operands are ∞ of the same sign, an invalid-operation exception is generated.

Table 3-48. FSUBR/FSUBRP/FISUBR Results

| DEST | SRC | | | | | | | |
|------|-----------|-----------|--------------------|----------------|----------------|--------------------|-----------|-----|
| | | $-\infty$ | $-F$ or $-I$ | -0 | $+0$ | $+F$ or $+I$ | $+\infty$ | NaN |
| | $-\infty$ | * | $+\infty$ | $+\infty$ | $+\infty$ | $+\infty$ | $+\infty$ | NaN |
| | $-F$ | $-\infty$ | $\pm F$ or ± 0 | $-\text{DEST}$ | $-\text{DEST}$ | $+F$ | $+\infty$ | NaN |
| | -0 | $-\infty$ | SRC | ± 0 | $+0$ | SRC | $+\infty$ | NaN |
| | $+0$ | $-\infty$ | SRC | -0 | ± 0 | SRC | $+\infty$ | NaN |
| | $+F$ | $-\infty$ | $-F$ | $-\text{DEST}$ | $-\text{DEST}$ | $\pm F$ or ± 0 | $+\infty$ | NaN |
| | $+\infty$ | $-\infty$ | $-\infty$ | $-\infty$ | $-\infty$ | $-\infty$ | * | NaN |
| | NaN | NaN | NaN | NaN | NaN | NaN | NaN | NaN |

NOTES:

F Means finite floating-point value.

I Means integer.

| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

FTST—TEST

| Opcode | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|--------|-------------|-------------|------------------|-------------------------|
| D9 E4 | FTST | Valid | Valid | Compare ST(0) with 0.0. |

Description

Compares the value in the ST(0) register with 0.0 and sets the condition code flags C0, C2, and C3 in the FPU status word according to the results (see table below).

Table 3-49. FTST Results

| Condition | C3 | C2 | C0 |
|-------------|----|----|----|
| ST(0) > 0.0 | 0 | 0 | 0 |
| ST(0) < 0.0 | 0 | 0 | 1 |
| ST(0) = 0.0 | 1 | 0 | 0 |
| Unordered | 1 | 1 | 1 |

This instruction performs an “unordered comparison.” An unordered comparison also checks the class of the numbers being compared (see “FXAM—Examine Floating-Point” in this chapter). If the value in register ST(0) is a NaN or is in an undefined format, the condition flags are set to “unordered” and the invalid operation exception is generated.

The sign of zero is ignored, so that ($-0.0 := +0.0$).

This instruction’s operation is the same in non-64-bit modes and 64-bit mode.

Operation

CASE (relation of operands) OF

Not comparable: C3, C2, C0 := 111;

ST(0) > 0.0: C3, C2, C0 := 000;

FUCOM/FUCOMP/FUCOMPP—Unordered Compare Floating-Point Values

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|---------|--------------|-------------|-----------------|--|
| DD E0+i | FUCOM ST(i) | Valid | Valid | Compare ST(0) with ST(i). |
| DD E1 | FUCOM | Valid | Valid | Compare ST(0) with ST(1). |
| DD E8+i | FUCOMP ST(i) | Valid | Valid | Compare ST(0) with ST(i) and pop register stack. |
| DD E9 | FUCOMP | Valid | Valid | Compare ST(0) with ST(1) and pop register stack. |
| DA E9 | FUCOMPP | Valid | Valid | Compare ST(0) with ST(1) and pop register stack twice. |

Description

Performs an unordered comparison of the contents of register ST(0) and ST(i) and sets condition code flags C0, C2, and C3 in the FPU status word according to the results (see the table below). If no operand is specified, the contents of registers ST(0) and ST(1) are compared. The sign of zero is ignored, so that -0.0 is equal to $+0.0$.

Table 3-50. FUCOM/FUCOMP/FUCOMPP Results

| Comparison Results* | C3 | C2 | C0 |
|---------------------|----|----|----|
| ST0 > ST(i) | 0 | 0 | 0 |
| ST0 < ST(i) | 0 | 0 | 1 |
| ST0 = ST(i) | 1 | 0 | 0 |
| Unordered | 1 | 1 | 1 |

NOTES:

* Flags not set if unmasked invalid-arithmetic-operand (#IA) exception is generated.

An unordered comparison checks the class of the numbers being compared (see “FXAM—Examine Floating-Point” in this chapter). The FUCOM/FUCOMP/FUCOMPP instructions perform the same operations as the FCOM/FCOMP/FCOMPP instructions. The only difference is that the FUCOM/FUCOMP/FUCOMPP instructions raise the invalid-arithmetic-operand exception (#IA) only when either or both operands are an SNaN or are in an unsupported format; QNaNs cause the condition code flags to be set to unordered, but do not cause an exception to be generated. The FCOM/FCOMP/FCOMPP instructions raise an invalid-operation exception when either or both of the operands are a NaN value of any kind or are in an unsupported format.

As with the FCOM/FCOMP/FCOMPP instructions, if the operation results in an invalid-arithmetic-operand exception being raised, the condition code flags are set only if the exception is masked.

The FUCOMP instruction pops the register stack following the comparison operation and the FUCOMPP instruction pops the register stack twice following the comparison operation. To pop the register stack, the processor marks the ST(0) register as empty and increments the stack pointer (TOP) by 1.

This instruction’s operation is the same in non-64-bit modes and 64-bit mode.

Operation

CASE (relation of operands) OF

FXAM—Examine Floating-Point

| Opcode | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|--------|-------------|-------------|------------------|------------------------------------|
| D9 E5 | FXAM | Valid | Valid | Classify value or number in ST(0). |

Description

Examines the contents of the ST(0) register and sets the condition code flags C0, C2, and C3 in the FPU status word to indicate the class of value or number in the register (see the table below).

Table 3-51. FXAM Results

| Class | C3 | C2 | C0 |
|----------------------|----|----|----|
| Unsupported | 0 | 0 | 0 |
| NaN | 0 | 0 | 1 |
| Normal finite number | 0 | 1 | 0 |
| Infinity | 0 | 1 | 1 |
| Zero | 1 | 0 | 0 |
| Empty | 1 | 0 | 1 |
| Denormal number | 1 | 1 | 0 |

The C1 flag is set to the sign of the value in ST(0), regardless of whether the register is empty or full.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

C1 := sign bit of ST; (* 0 for positive, 1 for negative *)

CASE (class of value or number in ST(0)) OF

 Unsupported: C3, C2, C0 := 000;

 NaN: C3, C2, C0 := 001;

 Normal: C3, C2, C0 := 010;

 Infinity: C3, C2, C0 := 011;

FXCH—Exchange Register Contents

| Opcode | Instruction | 64-Bit Mode | Compat/Leg Mode | Description |
|---------|-------------|-------------|-----------------|---|
| D9 C8+i | FXCH ST(i) | Valid | Valid | Exchange the contents of ST(0) and ST(i). |
| D9 C9 | FXCH | Valid | Valid | Exchange the contents of ST(0) and ST(1). |

Description

Exchanges the contents of registers ST(0) and ST(i). If no source operand is specified, the contents of ST(0) and ST(1) are exchanged.

This instruction provides a simple means of moving values in the FPU register stack to the top of the stack [ST(0)], so that they can be operated on by those floating-point instructions that can only operate on values in ST(0). For example, the following instruction sequence takes the square root of the third register from the top of the register stack:

```
FXCH ST(3);  
FSQRT;  
FXCH ST(3);
```

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

IF (Number-of-operands) is 1

THEN

```
temp := ST(0);  
ST(0) := SRC;  
SRC := temp;
```

ELSE

```
temp := ST(0);  
ST(0) := ST(1);  
ST(1) := temp;
```

FXRSTOR—Restore x87 FPU, MMX, XMM, and MXCSR State

| Opcode/ Instruction | Op/ En | 64-Bit Mode | Compat/ Leg Mode | Description |
|---|-----------|----------------|---------------------|--|
| NP OF AE /1 FXRSTOR m512byte | M | Valid | Valid | Restore the x87 FPU, MMX, XMM, and MXCSR register state from m512byte. |
| NP REX.W + OF AE /1 FXRSTOR64 m512byte | M | Valid | N.E. | Restore the x87 FPU, MMX, XMM, and MXCSR register state from m512byte. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|-----------|-----------|-----------|
| M | ModRM:r/m (r) | N/A | N/A | N/A |

Description

Reloads the x87 FPU, MMX technology, XMM, and MXCSR registers from the 512-byte memory image specified in the source operand. This data should have been written to memory previously using the FXSAVE instruction, and in the same format as required by the operating modes. The first byte of the data should be located on a 16-byte boundary. There are three distinct layouts of the FXSAVE state map: one for legacy and compatibility mode, a second format for 64-bit mode FXSAVE/FXRSTOR with REX.W=0, and the third format is for 64-bit mode with FXSAVE64/FXRSTOR64. Table 3-52 shows the layout of the legacy/compatibility mode state information in memory and describes the fields in the memory image for the FXRSTOR and FXSAVE instructions. Table 3-55 shows the layout of the 64-bit mode state information when REX.W is set (FXSAVE64/FXRSTOR64). Table 3-56 shows the layout of the 64-bit mode state information when REX.W is clear (FXSAVE/FXRSTOR).

The state image referenced with an FXRSTOR instruction must have been saved using an FXSAVE instruction or be in the same format as required by Table 3-52, Table 3-55, or Table 3-56. Referencing a state image saved with an FSAVE, FNSAVE instruction or incompatible field layout will result in an incorrect state restoration.

The FXRSTOR instruction does not flush pending x87 FPU exceptions. To check and raise exceptions when loading x87 FPU state information with the FXRSTOR instruction, use an FWAIT instruction after the FXRSTOR instruction.

If the OSFXSR bit in control register CR4 is not set, the FXRSTOR instruction may not restore the states of the XMM and MXCSR registers. This behavior is implementation dependent.

If the MXCSR state contains an unmasked exception with a corresponding status flag also set, loading the register with the FXRSTOR instruction will not result in a SIMD floating-point error condition being generated. Only the next occurrence of this unmasked exception will result in the exception being generated.

Bits 16 through 32 of the MXCSR register are defined as reserved and should be set to 0. Attempting to write a 1 in any of these bits from the saved state image will result in a general protection exception (#GP) being generated.

Bytes 464:511 of an FXSAVE image are available for software use. FXRSTOR ignores the content of bytes 464:511 in an FXSAVE state image.

Operation

```
IF 64-Bit Mode
    THEN
        (x87 FPU, MMX, XMM15-XMM0, MXCSR)  Load(SRC);
    ELSE
        (x87 FPU, MMX, XMM7-XMM0, MXCSR) := Load(SRC);
FI;
```

x87 FPU and SIMD Floating-Point Exceptions

None.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | For an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. If a memory operand is not aligned on a 16-byte boundary, regardless of segment. (See alignment check exception [#AC] below.) For an attempt to set reserved bits in MXCSR. |
| #SS(0) | For an illegal address in the SS segment. |
| #PF(fault-code) | For a page fault. |
| #NM | If CR0.TS[bit 3] = 1. If CR0.EM[bit 2] = 1. |
| #UD | If CPUID.01H:EDX.FXSR[bit 24] = 0. If instruction is preceded by a LOCK prefix. |
| #AC | If this exception is disabled a general protection exception (#GP) is signaled if the memory operand is not aligned on a 16-byte boundary, as described above. If the alignment check exception (#AC) is enabled (and the CPL is 3), signaling of #AC is not guaranteed and may vary with implementation, as follows. In all implementations where #AC is not signaled, a general protection exception is signaled in its place. In addition, the width of the alignment check may also vary with implementation. For instance, for a given implementation, an alignment check exception might be signaled for a 2-byte misalignment, whereas a general protection exception might be signaled for all other misalignments (4-, 8-, or 16-byte misalignments). |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand is not aligned on a 16-byte boundary, regardless of segment. If any part of the operand lies outside the effective address space from 0 to FFFFH. For an attempt to set reserved bits in MXCSR. |
| #NM | If CR0.TS[bit 3] = 1. If CR0.EM[bit 2] = 1. |
| #UD | If CPUID.01H:EDX.FXSR[bit 24] = 0. If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

Same exceptions as in real address mode.

| | |
|-----------------|---------------------------------|
| #PF(fault-code) | For a page fault. |
| #AC | For unaligned memory reference. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. If memory operand is not aligned on a 16-byte boundary, regardless of segment. For an attempt to set reserved bits in MXCSR. |
| #PF(fault-code) | For a page fault. |
| #NM | If CR0.TS[bit 3] = 1. If CR0.EM[bit 2] = 1. |
| #UD | If CPUID.01H:EDX.FXSR[bit 24] = 0. If instruction is preceded by a LOCK prefix. |
| #AC | If this exception is disabled a general protection exception (#GP) is signaled if the memory operand is not aligned on a 16-byte boundary, as described above. If the alignment check exception (#AC) is enabled (and the CPL is 3), signaling of #AC is not guaranteed and may vary with implementation, as follows. In all implementations where #AC is not signaled, a general protection exception is signaled in its place. In addition, the width of the alignment check may also vary with implementation. For instance, for a given implementation, an alignment check exception might be signaled for a 2-byte misalignment, whereas a general protection exception might be signaled for all other misalignments (4-, 8-, or 16-byte misalignments). |

FXSAVE—Save x87 FPU, MMX Technology, and SSE State

| Opcode/ Instruction | Op/ En | 64-Bit Mode | Compat/ Leg Mode | Description |
|--|-----------|----------------|---------------------|---|
| NP OF AE /0 FXSAVE m512byte | M | Valid | Valid | Save the x87 FPU, MMX, XMM, and MXCSR register state to m512byte. |
| NP REX.W + OF AE /0 FXSAVE64 m512byte | M | Valid | N.E. | Save the x87 FPU, MMX, XMM, and MXCSR register state to m512byte. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|-----------|-----------|-----------|
| M | ModRM:r/m (w) | N/A | N/A | N/A |

Description

Saves the current state of the x87 FPU, MMX technology, XMM, and MXCSR registers to a 512-byte memory location specified in the destination operand. The content layout of the 512 byte region depends on whether the processor is operating in non-64-bit operating modes or 64-bit sub-mode of IA-32e mode.

Bytes 464:511 are available to software use. The processor does not write to bytes 464:511 of an FXSAVE area.

The operation of FXSAVE in non-64-bit modes is described first.

Non-64-Bit Mode Operation

Table 3-52 shows the layout of the state information in memory when the processor is operating in legacy modes.

Table 3-52. Non-64-Bit-Mode Layout of FXSAVE and FXRSTOR Memory Region

| Available | | | | | | | | | | | | | | | | 496 |

The destination operand contains the first byte of the memory image, and it must be aligned on a 16-byte boundary. A misaligned destination operand will result in a general-protection (#GP) exception being generated (or in some cases, an alignment check exception [#AC]).

The FXSAVE instruction is used when an operating system needs to perform a context switch or when an exception handler needs to save and examine the current state of the x87 FPU, MMX technology, and/or XMM and MXCSR registers.

The fields in Table 3-52 are defined in Table 3-53.

Table 3-53. Field Definitions

| Field | Definition |
|--------------|--|
| FCW | x87 FPU Control Word (16 bits). See Figure 8-6 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, for the layout of the x87 FPU control word. |
| FSW | x87 FPU Status Word (16 bits). See Figure 8-4 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, for the layout of the x87 FPU status word. |
| Abridged FTW | x87 FPU Tag Word (8 bits). The tag information saved here is abridged, as described in the following paragraphs. |
| FOP | x87 FPU Opcode (16 bits). The lower 11 bits of this field contain the opcode, upper 5 bits are reserved. See Figure 8-8 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, for the layout of the x87 FPU opcode field. |
| FIP | x87 FPU Instruction Pointer Offset (64 bits). The contents of this field differ depending on the current addressing mode (32-bit, 16-bit, or 64-bit) of the processor when the FXSAVE instruction was executed: 32-bit mode — 32-bit IP offset. 16-bit mode — low 16 bits are IP offset; high 16 bits are reserved. 64-bit mode with REX.W — 64-bit IP offset. 64-bit mode without REX.W — 32-bit IP offset. See "x87 FPU Instruction and Operand (Data) Pointers" in Chapter 8 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, for a description of the x87 FPU instruction pointer. |
| FCS | x87 FPU Instruction Pointer Selector (16 bits). If CPUID.(EAX=07H,ECX=0H):EBX[bit 13] = 1, the processor deprecates FCS and FDS, and this field is saved as 0000H. |

Table 3-53. Field Definitions (Contd.)

| Field | Definition |
|-------------------------|---|
| FDP | x87 FPU Instruction Operand (Data) Pointer Offset (64 bits). The contents of this field differ depending on the current addressing mode (32-bit, 16-bit, or 64-bit) of the processor when the FXSAVE instruction was executed: 32-bit mode — 32-bit DP offset. 16-bit mode — low 16 bits are DP offset; high 16 bits are reserved. 64-bit mode with REX.W — 64-bit DP offset. 64-bit mode without REX.W — 32-bit DP offset. See “x87 FPU Instruction and Operand (Data) Pointers” in Chapter 8 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1, for a description of the x87 FPU operand pointer. |
| FDS | x87 FPU Instruction Operand (Data) Pointer Selector (16 bits). If CPUID.(EAX=07H,ECX=0H):EBX[bit 13] = 1, the processor deprecates FCS and FDS, and this field is saved as 0000H. |
| MXCSR | MXCSR Register State (32 bits). See Figure 10-3 in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1, for the layout of the MXCSR register. If the OSFXSR bit in control register CR4 is not set, the FXSAVE instruction may not save this register. This behavior is implementation dependent. |
| MXCSR_MASK | MXCSR_MASK (32 bits). This mask can be used to adjust values written to the MXCSR register, ensuring that reserved bits are set to 0. Set the mask bits and flags in MXCSR to the mode of operation desired for SSE and SSE2 SIMD floating-point instructions. See “Guidelines for Writing to the MXCSR Register” in Chapter 11 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1, for instructions for how to determine and use the MXCSR_MASK value. |
| ST0/MM0 through ST7/MM7 | x87 FPU or MMX technology registers. These 80-bit fields contain the x87 FPU data registers or the MMX technology registers, depending on the state of the processor prior to the execution of the FXSAVE instruction. If the processor had been executing x87 FPU instruction prior to the FXSAVE instruction, the x87 FPU data registers are saved; if it had been executing MMX instructions (or SSE or SSE2 instructions that operated on the MMX technology registers), the MMX technology registers are saved. When the MMX technology registers are saved, the high 16 bits of the field are reserved. |
| XMM0 through XMM7 | XMM registers (128 bits per field). If the OSFXSR bit in control register CR4 is not set, the FXSAVE instruction may not save these registers. This behavior is implementation dependent. |

The FXSAVE instruction saves an abridged version of the x87 FPU tag word in the FTW field (unlike the FSAVE instruction, which saves the complete tag word). The tag information is saved in physical register order (R0 through R7), rather than in top-of-stack (TOS) order. With the FXSAVE instruction, however, only a single bit (1 for valid or 0 for empty) is saved for each tag. For example, assume that the tag word is currently set as follows:

```

R7  R6  R5  R4  R3  R2  R1  R0
11  xx  xx  xx  11  11  11  11

```

Here, 11B indicates empty stack elements and “xx” indicates valid (00B), zero (01B), or special (10B).

For this example, the FXSAVE instruction saves only the following 8 bits of information:

```

R7  R6  R5  R4  R3  R2  R1  R0
0   1   1   1   0   0   0   0

```

Here, a 1 is saved for any valid, zero, or special tag, and a 0 is saved for any empty tag.

The operation of the FXSAVE instruction differs from that of the FSAVE instruction, the as follows:

- FXSAVE instruction does not check for pending unmasked floating-point exceptions. (The FXSAVE operation in this regard is similar to the operation of the FNSAVE instruction).
- After the FXSAVE instruction has saved the state of the x87 FPU, MMX technology, XMM, and MXCSR registers, the processor retains the contents of the registers. Because of this behavior, the FXSAVE instruction cannot be used by an application program to pass a “clean” x87 FPU state to a procedure, since it retains the current state. To clean the x87 FPU state, an application must explicitly execute a FINIT instruction after an FXSAVE instruction to reinitialize the x87 FPU state.

- The format of the memory image saved with the FXSAVE instruction is the same regardless of the current addressing mode (32-bit or 16-bit) and operating mode (protected, real address, or system management). This behavior differs from the FSAVE instructions, where the memory image format is different depending on the addressing mode and operating mode. Because of the different image formats, the memory image saved with the FXSAVE instruction cannot be restored correctly with the FRSTOR instruction, and likewise the state saved with the FSAVE instruction cannot be restored correctly with the FXRSTOR instruction.

The FSAVE format for FTW can be recreated from the FTW valid bits and the stored 80-bit floating-point data (assuming the stored data was not the contents of MMX technology registers) using Table 3-54.

Table 3-54. Recreating FSAVE Format

| Exponent all 1's | Exponent all 0's | Fraction all 0's | J and M bits | FTW valid bit | x87 FTW | |
|-----------------------------------|---------------------|---------------------|-----------------|---------------|---------|----|
| 0 | 0 | 0 | 0x | 1 | Special | 10 |
| 0 | 0 | 0 | 1x | 1 | Valid | 00 |
| 0 | 0 | 1 | 00 | 1 | Special | 10 |
| 0 | 0 | 1 | 10 | 1 | Valid | 00 |
| 0 | 1 | 0 | 0x | 1 | Special | 10 |
| 0 | 1 | 0 | 1x | 1 | Special | 10 |
| 0 | 1 | 1 | 00 | 1 | Zero | 01 |
| 0 | 1 | 1 | 10 | 1 | Special | 10 |
| 1 | 0 | 0 | 1x | 1 | Special | 10 |
| 1 | 0 | 0 | 1x | 1 | Special | 10 |
| 1 | 0 | 1 | 00 | 1 | Special | 10 |
| 1 | 0 | 1 | 10 | 1 | Special | 10 |
| For all legal combinations above. | | | | 0 | Empty | 11 |

The J-bit is defined to be the 1-bit binary integer to the left of the decimal place in the significand. The M-bit is defined to be the most significant bit of the fractional portion of the significand (i.e., the bit immediately to the right of the decimal place).

When the M-bit is the most significant bit of the fractional portion of the significand, it must be 0 if the fraction is all 0's.

IA-32e Mode Operation

In compatibility sub-mode of IA-32e mode, legacy SSE registers, XMM0 through XMM7, are saved according to the legacy FXSAVE map. In 64-bit mode, all of the SSE registers, XMM0 through XMM15, are saved. Additionally, there are two different layouts of the FXSAVE map in 64-bit mode, corresponding to FXSAVE64 (which requires REX.W=1) and FXSAVE (REX.W=0). In the FXSAVE64 map (Table 3-55), the FPU IP and FPU DP pointers are 64-bit wide. In the FXSAVE map for 64-bit mode (Table 3-56), the FPU IP and FPU DP pointers are 32-bits.

Table 3-55. Layout of the 64-Bit Mode FXSAVE64 Map (Requires REX.W = 1)

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

  FI;
```

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | For an illegal memory operand effective address in the CS, DS, ES, FS or GS segments. If a memory operand is not aligned on a 16-byte boundary, regardless of segment. (See the description of the alignment check exception [#AC] below.) |
| #SS(0) | For an illegal address in the SS segment. |
| #PF(fault-code) | For a page fault. |
| #NM | If CR0.TS[bit 3] = 1. If CR0.EM[bit 2] = 1. |
| #UD | If CPUID.01H:EDX.FXSR[bit 24] = 0. |
| #UD | If the LOCK prefix is used. |
| #AC | If this exception is disabled a general protection exception (#GP) is signaled if the memory operand is not aligned on a 16-byte boundary, as described above. If the alignment check exception (#AC) is enabled (and the CPL is 3), signaling of #AC is not guaranteed and may vary with implementation, as follows. In all implementations where #AC is not signaled, a general protection exception is signaled in its place. In addition, the width of the alignment check may also vary with implementation. For instance, for a given implementation, an alignment check exception might be signaled for a 2-byte misalignment, whereas a general protection exception might be signaled for all other misalignments (4-, 8-, or 16-byte misalignments). |

Real-Address Mode Exceptions

| | |
|-----|--|
| #GP | If a memory operand is not aligned on a 16-byte boundary, regardless of segment. If any part of the operand lies outside the effective address space from 0 to FFFFH. |
| #NM | If CR0.TS[bit 3] = 1. If CR0.EM[bit 2] = 1. |
| #UD | If CPUID.01H:EDX.FXSR[bit 24] = 0. If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

Same exceptions as in real address mode.

| | |
|-----------------|---------------------------------|
| #PF(fault-code) | For a page fault. |
| #AC | For unaligned memory reference. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. If memory operand is not aligned on a 16-byte boundary, regardless of segment. |
| #PF(fault-code) | For a page fault. |
| #NM | If CR0.TS[bit 3] = 1. If CR0.EM[bit 2] = 1. |
| #UD | If CPUID.01H:EDX.FXSR[bit 24] = 0. If the LOCK prefix is used. |
| #AC | If this exception is disabled a general protection exception (#GP) is signaled if the memory operand is not aligned on a 16-byte boundary, as described above. If the alignment check exception (#AC) is enabled (and the CPL is 3), signaling of #AC is not guaranteed and may vary with implementation, as follows. In all implementations where #AC is not signaled, a general protection exception is signaled in its place. In addition, the width of the alignment check may also vary with implementation. For instance, for a given implementation, an alignment check exception might be signaled for a 2-byte misalignment, whereas a general protection exception might be signaled for all other misalignments (4-, 8-, or 16-byte misalignments). |

Implementation Note

The order in which the processor signals general-protection (#GP) and page-fault (#PF) exceptions when they both occur on an instruction boundary is given in Table 5-2 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B. This order vary for FXSAVE for different processor implementations.

FXTRACT—Extract Exponent and Significand

| Opcode/ Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|------------------------|----------------|---------------------|---|
| D9 F4 FXTRACT | Valid | Valid | Separate value in ST(0) into exponent and significand, store exponent in ST(0), and push the significand onto the register stack. |

Description

Separates the source value in the ST(0) register into its exponent and significand, stores the exponent in ST(0), and pushes the significand onto the register stack. Following this operation, the new top-of-stack register ST(0) contains the value of the original significand expressed as a floating-point value. The sign and significand of this value are the same as those found in the source operand, and the exponent is 3FFFH (biased value for a true exponent of zero). The ST(1) register contains the value of the original operand's true (unbiased) exponent expressed as a floating-point value. (The operation performed by this instruction is a superset of the IEEE-recommended $\log_b(x)$ function.)

This instruction and the F2XM1 instruction are useful for performing power and range scaling operations. The FXTRACT instruction is also useful for converting numbers in double extended-precision floating-point format to decimal representations (e.g., for printing or displaying).

If the floating-point zero-divide exception (#Z) is masked and the source operand is zero, an exponent value of $-\infty$ is stored in register ST(1) and 0 with the sign of the source operand is stored in register ST(0).

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

```
TEMP := Significand(ST(0));  
ST(0) := Exponent(ST(0));  
TOP := TOP - 1;  
ST(0) := TEMP;
```

FPU Flags Affected

C1 Set to 0 if stack underflow occurred; set to 1 if stack overflow occurred.
C0, C2, C3 Undefined.

Floating-Point Exceptions

#IS Stack underflow or overflow occurred.
#IA Source operand is an SNaN value or unsupported format.
#Z ST(0) operand is ± 0 .
#D Source operand is a denormal value.

Protected Mode Exceptions

#NM CR0.EM[bit 2] or CR0.TS[bit 3] = 1.
#MF If there is a pending x87 FPU exception.
#UD If the LOCK prefix is used.

Real-Address Mode Exceptions

Same exceptions as in protected mode.

Virtual-8086 Mode Exceptions

Same exceptions as in protected mode.

Compatibility Mode Exceptions

FYL2X—Compute $y * \log_2 x$

| Opcode | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|--------|-------------|-------------|------------------|---|
| D9 F1 | FYL2X | Valid | Valid | Replace ST(1) with $(ST(1) * \log_2 ST(0))$ and pop the register stack. |

Description

Computes $(ST(1) * \log_2 (ST(0)))$, stores the result in register ST(1), and pops the FPU register stack. The source operand in ST(0) must be a non-zero positive number.

The following table shows the results obtained when taking the log of various classes of numbers, assuming that neither overflow nor underflow occurs.

Table 3-57. FYL2X Results

| | | ST(0) | | | | | | | |
|-------|-----------|-----------|------|-----------|---------------|------|-----------|-----------|-----|
| ST(1) | | $-\infty$ | $-F$ | ± 0 | $+0 < F < +1$ | $+1$ | $+F > +1$ | $+\infty$ | NaN |
| | $-\infty$ | * | * | $+\infty$ | $+\infty$ | * | $-\infty$ | $-\infty$ | NaN |
| | $-F$ | * | * | ** | $+F$ | -0 | $-F$ | $-\infty$ | NaN |
| | -0 | * | * | * | $+0$ | -0 | -0 | * | NaN |
| | $+0$ | * | * | * | -0 | $+0$ | $+0$ | * | NaN |
| | $+F$ | * | * | ** | $-F$ | $+0$ | $+F$ | $+\infty$ | NaN |
| | $+\infty$ | * | * | $-\infty$ | $-\infty$ | * | $+\infty$ | $+\infty$ | NaN |
| | NaN | NaN | NaN | NaN | NaN | NaN | NaN | NaN | NaN |

NOTES:

F Means finite floating-point value.

* Indicates floating-point invalid-operation (#IA) exception.

** Indicates floating-point zero-divide (#Z) exception.

If the divide-by-zero exception is masked and register ST(0) contains ± 0 , the instruction returns ∞ with a sign that is the opposite of the sign of the source operand in register ST(1).

The FYL2X instruction is designed with a built-in multiplication to optimize the calculation of logarithms with an arbitrary positive base (b):

$$\log_b x := (\log_2 b)^{-1} * \log_2 x$$

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

$ST(1) := ST(1) * \log_2 ST(0);$

PopRegisterStack;

FPU Flags Affected

| | |
|------------|--|
| C1 | Set to 0 if stack underflow occurred. |
| C0, C2, C3 | Set if result was rounded up; cleared otherwise. |
| | Undefined. |

Floating-Point Exceptions

| | |
|-----|---|
| #IS | Stack underflow occurred. |
| #IA | Either operand is an SNaN or unsupported format. Source operand in register ST(0) is a negative finite value (not -0). |
| #Z | Source operand in register ST(0) is ± 0 . |
| #D | Source operand is a denormal value. |
| #U | Result is too small for destination format. |
| #O | Result is too large for destination format. |
| #P | Value cannot be represented exactly in destination format. |

FYL2XP1—Compute $y * \log_2(x + 1)$

| Opcode | Instruction | 64-Bit Mode | Compat/ Leg Mode | Description |
|--------|-------------|-------------|------------------|--|
| D9 F9 | FYL2XP1 | Valid | Valid | Replace ST(1) with $ST(1) * \log_2(ST(0) + 1.0)$ and pop the register stack. |

Description

Computes $(ST(1) * \log_2(ST(0) + 1.0))$, stores the result in register ST(1), and pops the FPU register stack. The source operand in ST(0) must be in the range:

$$-(1 - \sqrt{2}/2) \text{ to } (1 - \sqrt{2}/2)$$

The source operand in ST(1) can range from $-\infty$ to $+\infty$. If the ST(0) operand is outside of its acceptable range, the result is undefined and software should not rely on an exception being generated. Under some circumstances exceptions may be generated when ST(0) is out of range, but this behavior is implementation specific and not guaranteed.

The following table shows the results obtained when taking the log epsilon of various classes of numbers, assuming that underflow does not occur.

Table 3-58. FYL2XP1 Results

| | | ST(0) | | | | |
|-------|-----------|--------------------------------------|-----|-----|-----------------------------|-----|
| ST(1) | | $-(1 - (\sqrt{2}/2)) \text{ to } -0$ | -0 | +0 | +0 to $+(1 - (\sqrt{2}/2))$ | NaN |
| | $-\infty$ | $+\infty$ | * | * | $-\infty$ | NaN |
| | -F | +F | +0 | -0 | -F | NaN |
| | -0 | +0 | +0 | -0 | -0 | NaN |
| | +0 | -0 | -0 | +0 | +0 | NaN |
| | +F | -F | -0 | +0 | +F | NaN |
| | $+\infty$ | $-\infty$ | * | * | $+\infty$ | NaN |
| | NaN | NaN | NaN | NaN | NaN | NaN |

NOTES:

F Means finite floating-point value.

* Indicates floating-point invalid-operation (#IA) exception.

This instruction provides optimal accuracy for values of epsilon [the value in register ST(0)] that are close to 0. For small epsilon (ϵ) values, more significant digits can be retained by using the FYL2XP1 instruction than by using $(\epsilon+1)$ as an argument to the FYL2X instruction. The $(\epsilon+1)$ expression is commonly found in compound interest and annuity calculations. The result can be simply converted into a value in another logarithm base by including a scale factor in the ST(1) source operand. The following equation is used to calculate the scale factor for a particular logarithm base, where n is the logarithm base desired for the result of the FYL2XP1 instruction:

$$\text{scale factor} := \log_n 2$$

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

$ST(1) := ST(1) * \log_2(ST(0) + 1.0);$

PopRegisterStack;

FPU Flags Affected

Description

The AFFINEINVB instruction computes an affine transformation in the Galois Field 2⁸. For this instruction, an affine transformation is defined by $A * \text{inv}(x) + b$ where “A” is an 8 by 8 bit matrix, and “x” and “b” are 8-bit vectors. The inverse of the bytes in x is defined with respect to the reduction polynomial $x^8 + x^4 + x^3 + x + 1$.

One SIMD register (operand 1) holds “x” as either 16, 32 or 64 8-bit vectors. A second SIMD (operand 2) register or memory operand contains 2, 4, or 8 “A” values, which are operated upon by the correspondingly aligned 8 “x” values in the first register. The “b” vector is constant for all calculations and contained in the immediate byte.

The EVEX encoded form of this instruction does not support memory fault suppression. The SSE encoded forms of the instruction require 16B alignment on their memory operations.

The inverse of each byte is given by the following table. The upper nibble is on the vertical axis and the lower nibble is on the horizontal axis. For example, the inverse of 0x95 is 0x8A.

Table 3-59. Inverse Byte Listings

Description

The AFFINEQB instruction computes an affine transformation in the Galois Field 2^8 . For this instruction, an affine transformation is defined by $A * x + b$ where “A” is an 8 by 8 bit matrix, and “x” and “b” are 8-bit vectors. One SIMD register (operand 1) holds “x” as either 16, 32 or 64 8-bit vectors. A second SIMD (operand 2) register or memory operand contains 2, 4, or 8 “A” values, which are operated upon by the correspondingly aligned 8 “x” values in the first register. The “b” vector is constant for all calculations and contained in the immediate byte.

The EVEX encoded form of this instruction does not support memory fault suppression. The SSE encoded forms of the instruction require 16B alignment on their memory operations.

Operation

define parity(x):

```

    t := 0           // single bit
    FOR i := 0 to 7:
        t = t xor x.bit[i]
    return t

```

define affine_byte(tsrc2qw, src1byte, imm):

```

    FOR i := 0 to 7:
        * parity(x) = 1 if x has an odd number of 1s in it, and 0 otherwise.*
        retbyte.bit[i] := parity(tsrc2qw.byte[7-i] AND src1byte) XOR imm8.bit[i]
    return retbyte

```

| C | Full Mem | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | N/A |

Description

The instruction multiplies elements in the finite field $GF(2^8)$, operating on a byte (field element) in the first source operand and the corresponding byte in a second source operand. The field $GF(2^8)$ is represented in polynomial representation with the reduction polynomial $x^8 + x^4 + x^3 + x + 1$.

This instruction does not support broadcasting.

The EVEX encoded form of this instruction supports memory fault suppression. The SSE encoded forms of the instruction require 16B alignment on their memory operations.

Operation

```
define gf2p8mul_byte(src1byte, src2byte):
    tword := 0
    FOR i := 0 to 7:
        IF src2byte.bit[i]:
            tword := tword XOR (src1byte<< i)
        * carry out polynomial reduction by the characteristic polynomial p*
    FOR i := 14 downto 8:
        p := 0x11B << (i-8)      *0x11B = 0000_0001_0001_1011 in binary*
        IF tword.bit[i]:
            tword := tword XOR p
    return tword.byte[0]
```

HLT—Halt

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------|-------------|-----------------|-------------|
| F4 | HLT | Z0 | Valid | Valid | Halt |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Stops instruction execution and places the processor in a HALT state. An enabled interrupt (including NMI and SMI), a debug exception, the BINIT# signal, the INIT# signal, or the RESET# signal will resume execution. If an interrupt (including NMI) is used to resume execution after a HLT instruction, the saved instruction pointer (CS:EIP) points to the instruction following the HLT instruction.

When a HLT instruction is executed on an Intel 64 or IA-32 processor supporting Intel Hyper-Threading Technology, only the logical processor that executes the instruction is halted. The other logical processors in the physical processor remain active, unless they are each individually halted by executing a HLT instruction.

The HLT instruction is a privileged instruction. When the processor is running in protected or virtual-8086 mode, the privilege level of a program or procedure must be 0 to execute the HLT instruction.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

Enter Halt state;

Flags Affected

None.

Protected Mode Exceptions

- #GP(0) If the current privilege level is not 0.
- #UD If the LOCK prefix is used.

Real-Address Mode Exceptions

None.

Virtual-8086 Mode Exceptions

Same exceptions as in protected mode.

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

Same exceptions as in protected mode.

HRESET—History Reset

| Opcode/ Instruction | Op/ En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|--|-----------|------------------------------|-----------------------|--|
| F3 0F 3A F0 C0 /ib HRESET imm8, <EAX> | A | V/V | HRESET | Processor history reset request. Controlled by the EAX implicit operand. |

Instruction Operand Encoding

| Op/En | Tuple | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-------|---------------|-----------|-----------|-----------|
| A | N/A | ModRM:r/m (r) | N/A | N/A | N/A |

Description

Requests the processor to selectively reset selected components of hardware history maintained by the current logical processor. HRESET operation is controlled by the implicit EAX operand. The value of the explicit imm8 operand is ignored. This instruction can only be executed at privilege level 0.

The HRESET instruction can be used to request reset of multiple components of hardware history. Prior to the execution of HRESET, the system software must take the following steps:

1. Enumerate the HRESET capabilities via CPUID.20H.0H:EBX, which indicates what components of hardware history can be reset.
2. Only the bits enumerated by CPUID.20H.0H:EBX can be set in the IA32_HRESET_ENABLE MSR.

HRESET causes a general-protection exception (#GP) if EAX sets any bits that are not set in the IA32_HRESET_ENABLE MSR.

Any attempt to execute the HRESET instruction inside a transactional region will result in a transaction abort.

Operation

```
IF EAX = 0
  THEN NOP
  ELSE
    FOREACH i such that EAX[i] = 1
      Reset prediction history for feature i
  FI
```

Flags Affected

None.

Protected Mode Exceptions

#GP(0) If CPL > 0 or (EAX AND NOT IA32_HRESET_ENABLE) ≠ 0.
#UD If CPUID.07H.01H:EAX.HRESET[bit 22] = 0.

Real-Address Mode Exceptions

Same exceptions as in protected mode.

Virtual-8086 Mode Exceptions

#GP(0) HRESET instruction is not recognized in virtual-8086 mode.

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

Same exceptions as in protected mode.

HSUBPD—Packed Double Precision Floating-Point Horizontal Subtract

| Opcode/ Instruction | Op/ En | 64/32-bit Mode | CPUID Feature Flag | Description |
|--|-----------|-------------------|--------------------------|---|

|-------|------------------|---------------|---------------|-----------|
| RM | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |
| RVM | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | N/A |

Description

The HSUBPD instruction subtracts horizontally the packed double precision floating-point numbers of both operands.

Subtracts the double precision floating-point value in the high quadword of the destination operand from the low quadword of the destination operand and stores the result in the low quadword of the destination operand.

Subtracts the double precision floating-point value in the high quadword of the source operand from the low quadword of the source operand and stores the result in the high quadword of the destination operand.

In 64-bit mode, use of the REX.R prefix permits this instruction to access additional registers (XMM8-XMM15).

See Figure 3-21 for HSUBPD; see Figure 3-22 for VHSUBPD.

OM15995

Figure 3-21. HSUBPD—Packed Double Precision Floating-Point Horizontal Subtract

Figure 3-23. HSUBPS—Packed Single Precision Floating-Point Horizontal Subtract

Figure 3-24. VHSUBPS Operation

128-bit Legacy SSE version: The second source can be an XMM register or a 128-bit memory location. The destination is not distinct from the first source XMM register and the upper bits (MAXVL-1:128) of the corresponding YMM register destination are unmodified.

VEX.128 encoded version: the first source operand is an XMM register or 128-bit memory location. The destination operand is an XMM register. The upper bits (MAXVL-1:128) of the corresponding YMM register destination are zeroed.

VEX.256 encoded version: The first source operand is a YMM register. The second source operand can be a YMM register or a 256-bit memory location. The destination operand is a YMM register.

Operation

HSUBPS (128-bit Legacy SSE Version)

$\text{DEST}[31:0] := \text{SRC1}[31:0] - \text{SRC1}[63:32]$
 $\text{DEST}[63:32] := \text{SRC1}[95:64] - \text{SRC1}[127:96]$
 $\text{DEST}[95:64] := \text{SRC2}[31:0] - \text{SRC2}[63:32]$
 $\text{DEST}[127:96] := \text{SRC2}[95:64] - \text{SRC2}[127:96]$
 $\text{DEST}[\text{MAXVL}-1:128]$ (Unmodified)

VHSUBPS (VEX.128 Encoded Version)

$\text{DEST}[31:0] := \text{SRC1}[31:0] - \text{SRC1}[63:32]$
 $\text{DEST}[63:32] := \text{SRC1}[95:64] - \text{SRC1}[127:96]$
 $\text{DEST}[95:64] := \text{SRC2}[31:0] - \text{SRC2}[63:32]$
 $\text{DEST}[127:96] := \text{SRC2}[95:64] - \text{SRC2}[127:96]$
 $\text{DEST}[\text{MAXVL}-1:128] := 0$

VHSUBPS (VEX.256 Encoded Version)

$\text{DEST}[31:0] := \text{SRC1}[31:0] - \text{SRC1}[63:32]$
 $\text{DEST}[63:32] := \text{SRC1}[95:64] - \text{SRC1}[127:96]$
 $\text{DEST}[95:64] := \text{SRC2}[31:0] - \text{SRC2}[63:32]$
 $\text{DEST}[127:96] := \text{SRC2}[95:64] - \text{SRC2}[127:96]$
 $\text{DEST}[159:128] := \text{SRC1}[159:128] - \text{SRC1}[191:160]$
 $\text{DEST}[191:160] := \text{SRC1}[223:192] - \text{SRC1}[255:224]$
 $\text{DEST}[223:192] := \text{SRC2}[159:128] - \text{SRC2}[191:160]$
 $\text{DEST}[255:224] := \text{SRC2}[223:192] - \text{SRC2}[255:224]$

Intel C/C++ Compiler Intrinsic Equivalent

`HSUBPS __m128 _mm_hsub_ps(__m128 a, __m128 b);`
`VHSUBPS __m256 _mm256_hsub_ps (__m256 a, __m256 b);`

Exceptions

When the source operand is a memory operand, the operand must be aligned on a 16-byte boundary or a general-protection exception (#GP) will be generated.

Numeric Exceptions

Overflow, Underflow, Invalid, Precision, Denormal.

Other Exceptions

See Table 2-19, “Type 2 Class Exception Conditions.”

IDIV—Signed Divide

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|---------------|------------------------|-------|-------------|-----------------|--|
| F6 /7 | IDIV r/m8 ¹ | M | Valid | Valid | Signed divide AX by r/m8, with result stored in: AL := Quotient, AH := Remainder. |
| F7 /7 | IDIV r/m16 | M | Valid | Valid | Signed divide DX:AX by r/m16, with result stored in AX := Quotient, DX := Remainder. |
| F7 /7 | IDIV r/m32 | M | Valid | Valid | Signed divide EDX:EAX by r/m32, with result stored in EAX := Quotient, EDX := Remainder. |
| REX.W + F7 /7 | IDIV r/m64 | M | Valid | N.E. | Signed divide RDX:RAX by r/m64, with result stored in RAX := Quotient, RDX := Remainder. |

NOTES:

1. With a REX prefix in 64-bit mode, attempts to access AH, BH, CH, or DH will instead access SPL, DIL, BPL, or SIL, respectively.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|-----------|-----------|-----------|
| M | ModRM:r/m (r) | N/A | N/A | N/A |

Description

Divides the (signed) value in the AX, DX:AX, or EDX:EAX (dividend) by the source operand (divisor) and stores the result in the AX (AH:AL), DX:AX, or EDX:EAX registers. The source operand can be a general-purpose register or a memory location. The action of this instruction depends on the operand size (dividend/divisor).

Non-integral results are truncated (chopped) towards 0. The remainder is always less than the divisor in magnitude. Overflow is indicated with the #DE (divide error) exception rather than with the CF flag.

In 64-bit mode, the instruction's default operation size is 32 bits. Use of the REX.R prefix permits access to additional registers (R8-R15). Use of the REX.W prefix promotes operation to 64 bits. In 64-bit mode when REX.W is applied, the instruction divides the signed value in RDX:RAX by the source operand. RAX contains a 64-bit quotient; RDX contains a 64-bit remainder.

See the summary chart at the beginning of this section for encoding data and limits. See Table 3-60.

Table 3-60. IDIV Results

| Operand Size | Dividend | Divisor | Quotient | Remainder | Quotient Range |
|--------------------------|----------|---------|----------|-----------|---|
| Word/byte | AX | r/m8 | AL | AH | −128 to +127 |
| Doubleword/word | DX:AX | r/m16 | AX | DX | −32,768 to +32,767 |
| Quadword/doubleword | EDX:EAX | r/m32 | EAX | EDX | −2 ³¹ to 2 ³¹ − 1 |
| Doublequadword/ quadword | RDX:RAX | r/m64 | RAX | RDX | −2 ⁶³ to 2 ⁶³ − 1 |

            FI;
        FI;
```

Flags Affected

The CF, OF, SF, ZF, AF, and PF flags are undefined.

Protected Mode Exceptions

| | |
|-----------------|--|
| #DE | If the source operand (divisor) is 0. The signed result (quotient) is too large for the destination. |
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register is used to access memory and it contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #DE | If the source operand (divisor) is 0. The signed result (quotient) is too large for the destination. |
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #DE | If the source operand (divisor) is 0. The signed result (quotient) is too large for the destination. |
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #DE | If the source operand (divisor) is 0 If the quotient is too large for the designated register. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

IMUL—Signed Multiply

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|------------------|------------------------|-------|-------------|-----------------|--|
| F6 /5 | IMUL r/m8 | M | Valid | Valid | AX:= AL * r/m byte. |

| F7 /5 | IMUL r/m32 | M | Valid | Valid | EDX:EAX := EAX * r/m32. |
| REX.W + F7 /5 | IMUL r/m64 | M | Valid | N.E. | RDX:RAX := RAX * r/m64. |
| 0F AF /r | IMUL r16, r/m16 | RM | Valid | Valid | Word register := word register * r/m16. |
| 0F AF /r | IMUL r32, r/m32 | RM | Valid | Valid | Doubleword register := doubleword register * r/m32. |
| REX.W + 0F AF /r | IMUL r64, r/m64 | RM | Valid | N.E. | Quadword register := Quadword register * r/m64. |
| 6B /r ib | IMUL r16, r/m16, imm8 | RMI | Valid | Valid | Word register := r/m16 * sign-extended immediate byte. |
| 6B /r ib | IMUL r32, r/m32, imm8 | RMI | Valid | Valid | Doubleword register := r/m32 * sign-extended immediate byte. |
| REX.W + 6B /r ib | IMUL r64, r/m64, imm8 | RMI | Valid | N.E. | Quadword register := r/m64 * sign-extended immediate byte. |
| 69 /r iw | IMUL r16, r/m16, imm16 | RMI | Valid | Valid | Word register := r/m16 * immediate word. |
| 69 /r id | IMUL r32, r/m32, imm32 | RMI | Valid | Valid | Doubleword register := r/m32 * immediate doubleword. |
| REX.W + 69 /r id | IMUL r64, r/m64, imm32 | RMI | Valid | N.E. | Quadword register := r/m64 * immediate doubleword. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------------|---------------|------------|-----------|
| M | ModRM:r/m (r, w) | N/A | N/A | N/A |
| RM | ModRM:reg (r, w) | ModRM:r/m (r) | N/A | N/A |
| RMI | ModRM:reg (r, w) | ModRM:r/m (r) | imm8/16/32 | N/A |

Description

Performs a signed multiplication of two operands. This instruction has three forms, depending on the number of operands.

- **One-operand form** — This form is identical to that used by the MUL instruction. Here, the source operand (in a general-purpose register or memory location) is multiplied by the value in the AL, AX, EAX, or RAX register (depending on the operand size) and the product (twice the size of the input operand) is stored in the AX, DX:AX, EDX:EAX, or RDX:RAX registers, respectively.
- **Two-operand form** — With this form the destination operand (the first operand) is multiplied by the source operand (second operand). The destination operand is a general-purpose register and the source operand is an immediate value, a general-purpose register, or a memory location. The intermediate product (twice the size of the input operand) is truncated and stored in the destination operand location.
- **Three-operand form** — This form requires a destination operand (the first operand) and two source operands (the second and the third operands). Here, the first source operand (which can be a general-purpose register or a memory location) is multiplied by the second source operand (an immediate value). The intermediate product (twice the size of the first source operand) is truncated and stored in the destination operand (a general-purpose register).

When an immediate value is used as an operand, it is sign-extended to the length of the destination operand format.

The CF and OF flags are set when the signed integer value of the intermediate product differs from the sign extended operand-size-truncated product, otherwise the CF and OF flags are cleared.

The three forms of the IMUL instruction are similar in that the length of the product is calculated to twice the length of the operands. With the one-operand form, the product is stored exactly in the destination. With the two- and three- operand forms, however, the result is truncated to the length of the destination before it is stored in the destination register. Because of this truncation, the CF or OF flag should be tested to ensure that no significant bits are lost.

The two- and three-operand forms may also be used with unsigned operands because the lower half of the product is the same regardless if the operands are signed or unsigned. The CF and OF flags, however, cannot be used to determine if the upper half of the result is non-zero.

In 64-bit mode, the instruction's default operation size is 32 bits. Use of the REX.R prefix permits access to additional registers (R8-R15). Use of the REX.W prefix promotes operation to 64 bits. Use of REX.W modifies the three forms of the instruction as follows.

- **One-operand form** —The source operand (in a 64-bit general-purpose register or memory location) is multiplied by the value in the RAX register and the product is stored in the RDX:RAX registers.
- **Two-operand form** — The source operand is promoted to 64 bits if it is a register or a memory location. The destination operand is promoted to 64 bits.
- **Three-operand form** — The first source operand (either a register or a memory location) and destination operand are promoted to 64 bits. If the source operand is an immediate, it is sign extended to 64 bits.

Operation

```

IF (NumberOfOperands = 1)
    THEN IF (OperandSize = 8)
        THEN
            TMP_XP := AL * SRC (* Signed multiplication; TMP_XP is a signed integer at twice the width of the SRC *);
            AX := TMP_XP[15:0];
            IF SignExtend(TMP_XP[7:0]) = TMP_XP
                THEN CF := 0; OF := 0;
                ELSE CF := 1; OF := 1; FI;
        ELSE IF OperandSize = 16
            THEN
                TMP_XP := AX * SRC (* Signed multiplication; TMP_XP is a signed integer at twice the width of the SRC *)
                DX:AX := TMP_XP[31:0];
                IF SignExtend(TMP_XP[15:0]) = TMP_XP
                    THEN CF := 0; OF := 0;
                    ELSE CF := 1; OF := 1; FI;
        ELSE IF OperandSize = 32
            THEN
                TMP_XP := EAX * SRC (* Signed multiplication; TMP_XP is a signed integer at twice the width of the SRC *)
                EDX:EAX := TMP_XP[63:0];
                IF SignExtend(TMP_XP[31:0]) = TMP_XP
                    THEN CF := 0; OF := 0;
                    ELSE CF := 1; OF := 1; FI;
        ELSE (* OperandSize = 64 *)
            TMP_XP := RAX * SRC (* Signed multiplication; TMP_XP is a signed integer at twice the width of the SRC *)
            EDX:EAX := TMP_XP[127:0];
            IF SignExtend(TMP_XP[63:0]) = TMP_XP
                THEN CF := 0; OF := 0;
                ELSE CF := 1; OF := 1; FI;
            FI;
    ELSE IF (NumberOfOperands = 2)
        THEN

```

```

    TMP_XP := DEST * SRC (* Signed multiplication; TMP_XP is a signed integer at twice the width of the SRC *)
    DEST := TruncateToOperandSize(TMP_XP);
    IF SignExtend(DEST) ≠ TMP_XP
        THEN CF := 1; OF := 1;
        ELSE CF := 0; OF := 0; FI;
ELSE (* NumberOfOperands = 3 *)
    TMP_XP := SRC1 * SRC2 (* Signed multiplication; TMP_XP is a signed integer at twice the width of the SRC1 *)
    DEST := TruncateToOperandSize(TMP_XP);
    IF SignExtend(DEST) ≠ TMP_XP
        THEN CF := 1; OF := 1;
        ELSE CF := 0; OF := 0; FI;
FI;
FI;

```

Flags Affected

For the one operand form of the instruction, the CF and OF flags are set when significant bits are carried into the upper half of the result and cleared when the result fits exactly in the lower half of the result. For the two- and three-operand forms of the instruction, the CF and OF flags are set when the result must be truncated to fit in the destination operand size and cleared when the result fits exactly in the destination operand size. The SF, ZF, AF, and PF flags are undefined.

Protected Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register is used to access memory and it contains a NULL NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

IN—Input From Port

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|--------------|-------|-------------|-----------------|--|
| E4 ib | IN AL, imm8 | I | Valid | Valid | Input byte from imm8 I/O port address into AL. |
| E5 ib | IN AX, imm8 | I | Valid | Valid | Input word from imm8 I/O port address into AX. |
| E5 ib | IN EAX, imm8 | I | Valid | Valid | Input dword from imm8 I/O port address into EAX. |

| ED | IN AX,DX | ZO | Valid | Valid | Input word from I/O port in DX into AX. |
| ED | IN EAX,DX | ZO | Valid | Valid | Input doubleword from I/O port in DX into EAX. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| I | imm8 | N/A | N/A | N/A |
| ZO | N/A | N/A | N/A | N/A |

Description

Copies the value from the I/O port specified with the second operand (source operand) to the destination operand (first operand). The source operand can be a byte-immediate or the DX register; the destination operand can be register AL, AX, or EAX, depending on the size of the port being accessed (8, 16, or 32 bits, respectively). Using the DX register as a source operand allows I/O port addresses from 0 to 65,535 to be accessed; using a byte immediate allows I/O port addresses 0 to 255 to be accessed.

When accessing an 8-bit I/O port, the opcode determines the port size; when accessing a 16- and 32-bit I/O port, the operand-size attribute determines the port size. At the machine code level, I/O instructions are shorter when accessing 8-bit I/O ports. Here, the upper eight bits of the port address will be 0.

This instruction is only useful for accessing I/O ports located in the processor's I/O address space. See Chapter 20, "Input/Output," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, for more information on accessing I/O ports in the I/O address space.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Operation

```
IF ((PE = 1) and ((CPL > IOPL) or (VM = 1)))  
  THEN (* Protected mode with CPL > IOPL or virtual-8086 mode *)  
    IF (Any I/O Permission Bit for I/O port being accessed = 1)  
      THEN (* I/O operation is not allowed *)  
        #GP(0);  
      ELSE (* I/O operation is allowed *)  
        DEST := SRC; (* Read from selected I/O port *)  
    FI;  
  ELSE (Real Mode or Protected Mode with CPL ≤ IOPL *)  
    DEST := SRC; (* Read from selected I/O port *)  
  FI;
```

Flags Affected

None.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If the CPL is greater than (has less privilege) the I/O privilege level (IOPL) and any of the corresponding I/O permission bits in TSS for the I/O port being accessed is 1. |
| #PF(fault-code) | If a page fault occurs. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|-----------------------------|
| #UD | If the LOCK prefix is used. |
|-----|-----------------------------|

Virtual-8086 Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If any of the I/O permission bits in the TSS for the I/O port being accessed is 1. |
| #PF(fault-code) | If a page fault occurs. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If the CPL is greater than (has less privilege) the I/O privilege level (IOPL) and any of the corresponding I/O permission bits in TSS for the I/O port being accessed is 1. |

| #UD | If the LOCK prefix is used. |

INC—Increment by 1

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|---------------------|-----------------------|-------|-------------|-----------------|-------------------------------------|
| FE /0 | INC r/m8 ¹ | M | Valid | Valid | Increment r/m byte by 1. |
| FF /0 | INC r/m16 | M | Valid | Valid | Increment r/m word by 1. |
| FF /0 | INC r/m32 | M | Valid | Valid | Increment r/m doubleword by 1. |
| REX.W + FF /0 | INC r/m64 | M | Valid | N.E. | Increment r/m quadword by 1. |
| 40+ rw ² | INC r16 | O | N.E. | Valid | Increment word register by 1. |
| 40+ rd | INC r32 | O | N.E. | Valid | Increment doubleword register by 1. |

NOTES:

1. With a REX prefix in 64-bit mode, attempts to access AH, BH, CH, or DH will instead access SPL, DIL, BPL, or SIL, respectively.
2. 40H through 47H are REX prefixes in 64-bit mode.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|--------------------|-----------|-----------|-----------|
| M | ModRM:r/m (r, w) | N/A | N/A | N/A |
| O | opcode + rd (r, w) | N/A | N/A | N/A |

Description

Adds 1 to the destination operand, while preserving the state of the CF flag. The destination operand can be a register or a memory location. This instruction allows a loop counter to be updated without disturbing the CF flag. (Use a ADD instruction with an immediate operand of 1 to perform an increment operation that does updates the CF flag.)

This instruction can be used with a LOCK prefix to allow the instruction to be executed atomically.

In 64-bit mode, INC r16 and INC r32 are not encodable (because opcodes 40H through 47H are REX prefixes). Otherwise, the instruction's 64-bit mode default operation size is 32 bits. Use of the REX.R prefix permits access to additional registers (R8-R15). Use of the REX.W prefix promotes operation to 64 bits.

Operation

DEST := DEST + 1;

Flags Affected

The CF flag is not affected. The OF, SF, ZF, AF, and PF flags are set according to the result.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If the destination operand is located in a non-writable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register is used to access memory and it contains a NULL segment selector. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
|-----|---|

| | |
|-----|---|
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory address is in a non-canonical form. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If the LOCK prefix is used but the destination is not a memory operand. |

INCSSPD/INCSSPQ—Increment Shadow Stack Pointer

| Opcode/ Instruction | Op / En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|-----------------------------------|------------|------------------------------|--------------------------|--------------------------------|
| F3 OF AE /05 INCSSPD r32 | R | V/V | CET_SS | Increment SSP by 4 * r32[7:0]. |
| F3 REX.W OF AE /05 INCSSPQ r64 | R | V/N.E. | CET_SS | Increment SSP by 8 * r64[7:0]. |

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|------------|---------------|-----------|-----------|-----------|
| R | N/A | ModRM:r/m (r) | N/A | N/A | N/A |

Description

This instruction can be used to increment the current shadow stack pointer by the operand size of the instruction times the unsigned 8-bit value specified by bits 7:0 in the source operand. The instruction performs a pop and discard of the first and last element on the shadow stack in the range specified by the unsigned 8-bit value in bits 7:0 of the source operand.

Operation

```
IF CPL = 3
    IF (CR4.CET & IA32_U_CET.SH_STK_EN) = 0
        THEN #UD; FI;
ELSE
    IF (CR4.CET & IA32_S_CET.SH_STK_EN) = 0
        THEN #UD; FI;
FI;

IF (operand size is 64-bit)
    THEN
        Range := R64[7:0];
        shadow_stack_load 8 bytes from SSP;
        IF Range > 0
            THEN shadow_stack_load 8 bytes from SSP + 8 * (Range - 1);
        FI;
        SSP := SSP + Range * 8;
    ELSE
        Range := R32[7:0];
        shadow_stack_load 4 bytes from SSP;
        IF Range > 0
            THEN shadow_stack_load 4 bytes from SSP + 4 * (Range - 1);
        FI;
        SSP := SSP + Range * 4;
FI;
```

Flags Affected

None.

Intel C/C++ Compiler Intrinsic Equivalent

```
INCSSPD void _incsspd(int);
INCSSPQ void _incsspq(int);
```

Protected Mode Exceptions

#UD If the LOCK prefix is used.
 If CR4.CET = 0.
 IF CPL = 3 and IA32_U_CET.SH_STK_EN = 0.
 IF CPL < 3 and IA32_S_CET.SH_STK_EN = 0.

#PF(fault-code) If a page fault occurs.

Real-Address Mode Exceptions

#UD The INCSSP instruction is not recognized in real-address mode.

Virtual-8086 Mode Exceptions

#UD The INCSSP instruction is not recognized in virtual-8086 mode.

Instruction Operand Encoding

| Op/En | Tuple Type | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|------------------|---------------|---------------|-----------|
| A | N/A | ModRM:reg (r, w) | ModRM:r/m (r) | imm8 | N/A |
| B | N/A | ModRM:reg (w) | VEX.vvvv (r) | ModRM:r/m (r) | imm8 |
| C | Tuple1 Scalar | ModRM:reg (w) | EVEX.vvvv (r) | ModRM:r/m (r) | imm8 |

Description

(register source form)

Copy a single precision scalar floating-point element into a 128-bit vector register. The immediate operand has three fields, where the ZMask bits specify which elements of the destination will be set to zero, the Count_D bits specify which element of the destination will be overwritten with the scalar value, and for vector register sources the Count_S bits specify which element of the source will be copied. When the scalar source is a memory operand the Count_S bits are ignored.

(memory source form)

Load a floating-point element from a 32-bit memory location and destination operand it into the first source at the location indicated by the Count_D bits of the immediate operand. Store in the destination and zero out destination elements based on the ZMask bits of the immediate operand.

128-bit Legacy SSE version: The first source register is an XMM register. The second source operand is either an XMM register or a 32-bit memory location. The destination is not distinct from the first source XMM register and the upper bits (MAXVL-1:128) of the corresponding register destination are unmodified.

VEX.128 and EVEX encoded version: The destination and first source register is an XMM register. The second source operand is either an XMM register or a 32-bit memory location. The upper bits (MAXVL-1:128) of the corresponding register destination are zeroed.

If VININSERTPS is encoded with VEX.L= 1, an attempt to execute the instruction encoded with VEX.L= 1 will cause an #UD exception.

Operation

VINSERTPS (VEX.128 and EVEX Encoded Version)

```

INS/INSB/INSW/INSD—Input from Port to String

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------|-------------|-----------------|--|
| 6C | INS m8, DX | ZO | Valid | Valid | Input byte from I/O port specified in DX into memory location specified in ES:(E)DI or RDI. ¹ |
| 6D | INS m16, DX | ZO | Valid | Valid | Input word from I/O port specified in DX into memory location specified in ES:(E)DI or RDI. ¹ |
| 6D | INS m32, DX | ZO | Valid | Valid | Input doubleword from I/O port specified in DX into memory location specified in ES:(E)DI or RDI. ¹ |
| 6C | INSB | ZO | Valid | Valid | Input byte from I/O port specified in DX into memory location specified with ES:(E)DI or RDI. ¹ |
| 6D | INSW | ZO | Valid | Valid | Input word from I/O port specified in DX into memory location specified in ES:(E)DI or RDI. ¹ |
| 6D | INSD | ZO | Valid | Valid | Input doubleword from I/O port specified in DX into memory location specified in ES:(E)DI or RDI. ¹ |

NOTES:

1. In 64-bit mode, only 64-bit (RDI) and 32-bit (EDI) address sizes are supported. In non-64-bit mode, only 32-bit (EDI) and 16-bit (DI) address sizes are supported.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| ZO | N/A | N/A | N/A | N/A |

Description

Copies the data from the I/O port specified with the source operand (second operand) to the destination operand (first operand). The source operand is an I/O port address (from 0 to 65,535) that is read from the DX register. The destination operand is a memory location, the address of which is read from either the ES:DI, ES:EDI or the RDI registers (depending on the address-size attribute of the instruction, 16, 32 or 64, respectively). (The ES segment cannot be overridden with a segment override prefix.) The size of the I/O port being accessed (that is, the size of the source and destination operands) is determined by the opcode for an 8-bit I/O port or by the operand-size attribute of the instruction for a 16- or 32-bit I/O port.

At the assembly-code level, two forms of this instruction are allowed: the “explicit-operands” form and the “no-operands” form. The explicit-operands form (specified with the INS mnemonic) allows the source and destination operands to be specified explicitly. Here, the source operand must be “DX,” and the destination operand should be a symbol that indicates the size of the I/O port and the destination address. This explicit-operands form is provided to allow documentation; however, note that the documentation provided by this form can be misleading. That is, the destination operand symbol must specify the correct **type** (size) of the operand (byte, word, or doubleword), but it does not have to specify the correct **location**. The location is always specified by the ES:(E)DI registers, which must be loaded correctly before the INS instruction is executed.

The no-operands form provides “short forms” of the byte, word, and doubleword versions of the INS instructions. Here also DX is assumed by the processor to be the source operand and ES:(E)DI is assumed to be the destination operand. The size of the I/O port is specified with the choice of mnemonic: INSB (byte), INSW (word), or INSD (doubleword).

After the byte, word, or doubleword is transfer from the I/O port to the memory location, the DI/EDI/RDI register is incremented or decremented automatically according to the setting of the DF flag in the EFLAGS register. (If the DF flag is 0, the (E)DI register is incremented; if the DF flag is 1, the (E)DI register is decremented.) The (E)DI register is incremented or decremented by 1 for byte operations, by 2 for word operations, or by 4 for doubleword operations.

The INS, INSB, INSW, and INSD instructions can be preceded by the REP prefix for block input of ECX bytes, words, or doublewords. See “REP/REPE/REPZ /REPNE/REPZ—Repeat String Operation Prefix” in Chapter 4 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2B, for a description of the REP prefix.

These instructions are only useful for accessing I/O ports located in the processor’s I/O address space. See Chapter 20, “Input/Output,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1, for more information on accessing I/O ports in the I/O address space.

In 64-bit mode, default address size is 64 bits, 32 bit address size is supported using the prefix 67H. The address of the memory destination is specified by RDI or EDI. 16-bit address size is not supported in 64-bit mode. The operand size is not promoted.

These instructions may read from the I/O port without writing to the memory location if an exception or VM exit occurs due to the write (e.g. #PF). If this would be problematic, for example because the I/O port read has side-effects, software should ensure the write to the memory location does not cause an exception or VM exit.

Operation

```
IF ((PE = 1) and ((CPL > IOPL) or (VM = 1)))
  THEN (* Protected mode with CPL > IOPL or virtual-8086 mode *)
    IF (Any I/O Permission Bit for I/O port being accessed = 1)
      THEN (* I/O operation is not allowed *)
        #GP(0);
      ELSE (* I/O operation is allowed *)
        DEST := SRC; (* Read from I/O port *)
    FI;
  ELSE (Real Mode or Protected Mode with CPL IOPL *)
    DEST := SRC; (* Read from I/O port *)
```

FI;

Non-64-bit Mode:

```

|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |
| I | imm8 | N/A | N/A | N/A |

Description

The INT *n* instruction generates a call to the interrupt or exception handler specified with the destination operand (see the section titled “Interrupts and Exceptions” in Chapter 6 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1). The destination operand specifies a vector from 0 to 255, encoded as an 8-bit unsigned intermediate value. Each vector provides an index to a gate descriptor in the IDT. The first 32 vectors are reserved by Intel for system use. Some of these vectors are used for internally generated exceptions.

The INT *n* instruction is the general mnemonic for executing a software-generated call to an interrupt handler. The INTO instruction is a special mnemonic for calling overflow exception (#OF), exception 4. The overflow interrupt checks the OF flag in the EFLAGS register and calls the overflow interrupt handler if the OF flag is set to 1. (The INTO instruction cannot be used in 64-bit mode.)

The INT3 instruction uses a one-byte opcode (CC) and is intended for calling the debug exception handler with a breakpoint exception (#BP). (This one-byte form is useful because it can replace the first byte of any instruction at which a breakpoint is desired, including other one-byte instructions, without overwriting other instructions.)

The INT1 instruction also uses a one-byte opcode (F1) and generates a debug exception (#DB) without setting any bits in DR6.¹ Hardware vendors may use the INT1 instruction for hardware debug. For that reason, Intel recommends software vendors instead use the INT3 instruction for software breakpoints.

An interrupt generated by the INTO, INT3, or INT1 instruction differs from one generated by INT *n* in the following ways:

- The normal IOPL checks do not occur in virtual-8086 mode. The interrupt is taken (without fault) with any IOPL value.
- The interrupt redirection enabled by the virtual-8086 mode extensions (VME) does not occur. The interrupt is always handled by a protected-mode handler.

(These features do not pertain to CD03, the “normal” 2-byte opcode for INT 3. Intel and Microsoft assemblers will not generate the CD03 opcode from any mnemonic, but this opcode can be created by direct numeric code definition or by self-modifying code.)

The action of the INT *n* instruction (including the INTO, INT3, and INT1 instructions) is similar to that of a far call made with the CALL instruction. The primary difference is that with the INT *n* instruction, the EFLAGS register is pushed onto the stack before the return address. (The return address is a far address consisting of the current values of the CS and EIP registers.) Returns from interrupt procedures are handled with the IRET instruction, which pops the EFLAGS information and return address from the stack.

Each of the INT *n*, INTO, and INT3 instructions generates a general-protection exception (#GP) if the CPL is greater than the DPL value in the selected gate descriptor in the IDT. In contrast, the INT1 instruction can deliver a #DB

1. The mnemonic ICEBP has also been used for the instruction with opcode F1.

even if the CPL is greater than the DPL of descriptor 1 in the IDT. (This behavior supports the use of INT1 by hardware vendors performing hardware debug.)

The vector specifies an interrupt descriptor in the interrupt descriptor table (IDT); that is, it provides index into the IDT. The selected interrupt descriptor in turn contains a pointer to an interrupt or exception handler procedure. In protected mode, the IDT contains an array of 8-byte descriptors, each of which is an interrupt gate, trap gate, or task gate. In real-address mode, the IDT is an array of 4-byte far pointers (2-byte code segment selector and a 2-byte instruction pointer), each of which point directly to a procedure in the selected segment. (Note that in real-address mode, the IDT is called the **interrupt vector table**, and its pointers are called interrupt vectors.)

The following decision table indicates which action in the lower portion of the table is taken given the conditions in the upper portion of the table. Each Y in the lower section of the decision table represents a procedure defined in the “Operation” section for this instruction (except #GP).

Table 3-61. Decision Table

| | | | | | | | | |
|----------------------------------|---|-----------|------|-------------------|-------------------|-------------------|-------------------|-------------------|
| PE | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| INTERRUPT-FROM-VIRTUAL-8086-MODE | | | | | | | | Y |
| TASK-GATE | | | Y | | | | | |
| #GP | | Y | | Y | | | Y | |

NOTES:

- Don't Care.
- Y Yes, action taken.
- Blank Action not taken.
- S/W Applies to INT *n*, INT3, and INTO, but not to INT1.

When the processor is executing in virtual-8086 mode, the IOPL determines the action of the INT *n* instruction. If the IOPL is less than 3, the processor generates a #GP(selector) exception; if the IOPL is 3, the processor executes a protected mode interrupt to privilege level 0. The interrupt gate's DPL must be set to 3 and the target CPL of the interrupt handler procedure must be 0 to execute the protected mode interrupt to privilege level 0.

The interrupt descriptor table register (IDTR) specifies the base linear address and limit of the IDT. The initial base address value of the IDTR after the processor is powered up or reset is 0.

Refer to Chapter 6, “Procedure Calls, Interrupts, and Exceptions” and Chapter 18, “Control-flow Enforcement Technology (CET)” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1, for CET details.

Instruction ordering. Instructions following an INT *n* may be fetched from memory before earlier instructions complete execution, but they will not execute (even speculatively) until all instructions prior to the INT *n* have completed execution (the later instructions may execute before data stored by the earlier instructions have become globally visible). This applies also to the INTO, INT3, and INT1 instructions, but not to executions of INTO when EFLAGS.OF = 0.

Operation

The following operational description applies not only to the INT *n*, INTO, INT3, or INT1 instructions, but also to external interrupts, nonmaskable interrupts (NMIs), and exceptions. Some of these events push onto the stack an error code.

The operational description specifies numerous checks whose failure may result in delivery of a nested exception. In these cases, the original event is not delivered.

The operational description specifies the error code delivered by any nested exception. In some cases, the error code is specified with a pseudofunction `error_code(num,idt,ext)`, where `idt` and `ext` are bit values. The pseudofunction produces an error code as follows: (1) if `idt` is 0, the error code is $(\text{num} \& \text{FCH}) \mid \text{ext}$; (2) if `idt` is 1, the error code is $(\text{num} \ll 3) \mid 2 \mid \text{ext}$.

In many cases, the pseudofunction `error_code` is invoked with a pseudovariable `EXT`. The value of `EXT` depends on the nature of the event whose delivery encountered a nested exception: if that event is a software interrupt (INT *n*, INT3, or INTO), `EXT` is 0; otherwise (including INT1), `EXT` is 1.

```

Flags Affected

The EFLAGS register is pushed onto the stack. The IF, TF, NT, AC, RF, and VM flags may be cleared, depending on the mode of operation of the processor when the INT instruction is executed (see the “Operation” section). If the interrupt uses a task gate, any flags may be set or cleared, controlled by the EFLAGS image in the new task’s TSS.

Protected Mode Exceptions

#GP(error_code) If the instruction pointer in the IDT or in the interrupt, trap, or task gate is beyond the code segment limits.

If the segment selector in the interrupt, trap, or task gate is NULL.

If an interrupt, trap, or task gate, code segment, or TSS segment selector index is outside its descriptor table limits.

If the vector selects a descriptor outside the IDT limits.

If an IDT descriptor is not an interrupt, trap, or task gate.

If an interrupt is generated by the INT *n*, INT3, or INTO instruction and the DPL of an interrupt, trap, or task gate is less than the CPL.

If the segment selector in an interrupt or trap gate does not point to a segment descriptor for a code segment.

If the segment selector for a TSS has its local/global bit set for local.

If a TSS segment descriptor specifies that the TSS is busy or not available.

If SSP in IA32_PLi_SSP (where *i* is the new CPL) is not 8 byte aligned.

If the token and the stack frame to be pushed on shadow stack are not contained in a naturally aligned 32-byte region of the shadow stack.

If “supervisor Shadow Stack” token on new shadow stack is marked busy.

If destination mode is 32-bit or compatibility mode, but SSP address in “supervisor shadow stack” token is beyond 4GB.

If SSP address in “supervisor shadow stack” token does not match SSP address in IA32_PLi_SSP (where *i* is the new CPL).

INVD—Invalidate Internal Caches

| Opcode ¹ | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|---------------------|-------------|-------|-------------|-----------------|--|
| OF 08 | INVD | Z0 | Valid | Valid | Flush internal caches; initiate flushing of external caches. |

NOTES:

1. See the IA-32 Architecture Compatibility section below.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Invalidates (flushes) the processor's internal caches and issues a special-function bus cycle that directs external caches to also flush themselves. Data held in internal caches is not written back to main memory.

After executing this instruction, the processor does not wait for the external caches to complete their flushing operation before proceeding with instruction execution. It is the responsibility of hardware to respond to the cache flush signal.

The INVD instruction is a privileged instruction. When the processor is running in protected mode, the CPL of a program or procedure must be 0 to execute this instruction.

The INVD instruction may be used when the cache is used as temporary memory and the cache contents need to be invalidated rather than written back to memory. When the cache is used as temporary memory, no external device should be actively writing data to main memory.

Use this instruction with care. Data cached internally and not written back to main memory will be lost. Note that any data from an external device to main memory (for example, via a PCIWrite) can be temporarily stored in the caches; these data can be lost when an INVD instruction is executed. Unless there is a specific requirement or benefit to flushing caches without writing back modified cache lines (for example, temporary memory, testing, or fault recovery where cache coherency with main memory is not a concern), software should instead use the WBINVD instruction.

On processors that support processor reserved memory, the INVD instruction cannot be executed when processor reserved memory protections are activated. See Section 37.5, "EPC and Management of EPC Pages," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D.

Some processors prevent execution of INVD after BIOS execution is complete. They report this by enumerating CPUID.(EAX=07H,ECX=1H):EAX[bit 30] as 1. On such processors, INVD cannot be executed if bit 0 of SR_BIOS_DONE (MSR address 151H) is 1.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

IA-32 Architecture Compatibility

The INVD instruction is implementation dependent; it may be implemented differently on different families of Intel 64 or IA-32 processors. This instruction is not supported on IA-32 processors earlier than the Intel486 processor.

Operation

Flush(InternalCaches);
SignalFlush(ExternalCaches);
Continue (* Continue execution *)

Flags Affected

None.

Protected Mode Exceptions

| | |
|--------|---|
| #GP(0) | If the current privilege level is not 0. If the processor reserved memory protections are activated. If CPUID.(EAX=07H, ECX=1H):EAX[30] = 1 and bit 0 is set in MSR_BIOS_DONE (MSR address 151H). |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|--------|---|
| #GP(0) | If CPUID.(EAX=07H, ECX=1H):EAX[30] = 1 and bit 0 is set in MSR_BIOS_DONE (MSR address 151H). If the processor reserved memory protections are activated. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|--------|---|
| #GP(0) | The INVD instruction cannot be executed in virtual-8086 mode. |
|--------|---|

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

Same exceptions as in protected mode.

INVLPG—Invalidate TLB Entries

| Opcode ¹ | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|---------------------|-------------|-------|-------------|-----------------|---|
| OF 01/7 | INVLPG m | M | Valid | Valid | Invalidate TLB entries for page containing m. |

NOTES:

1. See the IA-32 Architecture Compatibility section below.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|-----------|-----------|-----------|
| M | ModRM:r/m (r) | N/A | N/A | N/A |

Description

Invalidates any translation lookaside buffer (TLB) entries specified with the source operand. The source operand is a memory address. The processor determines the page that contains that address and flushes all TLB entries for that page.¹

The INVLPG instruction is a privileged instruction. When the processor is running in protected mode, the CPL must be 0 to execute this instruction.

The INVLPG instruction normally flushes TLB entries only for the specified page; however, in some cases, it may flush more entries, even the entire TLB. The instruction invalidates TLB entries associated with the current PCID and may or may not do so for TLB entries associated with other PCIDs. (If PCIDs are disabled — CR4.PCIDE = 0 — the current PCID is 000H.) The instruction also invalidates any global TLB entries for the specified page, regardless of PCID.

For more details on operations that flush the TLB, see “MOV—Move to/from Control Registers” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2B, and Section 5.10.4.1, “Operations that Invalidate TLBs and Paging-Structure Caches,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A.

This instruction’s operation is the same in all non-64-bit modes. It also operates the same in 64-bit mode, except if the memory address is in non-canonical form. In this case, INVLPG is the same as a NOP.

IA-32 Architecture Compatibility

The INVLPG instruction is implementation dependent, and its function may be implemented differently on different families of Intel 64 or IA-32 processors. This instruction is not supported on IA-32 processors earlier than the Intel486 processor.

Operation

Invalidate(RelevantTLBEntries);
Continue; (* Continue execution *)

Flags Affected

None.

Protected Mode Exceptions

#GP(0) If the current privilege level is not 0.
#UD Operand is a register.
If the LOCK prefix is used.

1. If the paging structures map the linear address using a page larger than 4 KBytes and there are multiple TLB entries for that page (see Section 5.10.2.3, “Details of TLB Use,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A), the instruction invalidates all of them.

Real-Address Mode Exceptions

#UD Operand is a register.
 If the LOCK prefix is used.

Virtual-8086 Mode Exceptions

#GP(0) The INVLPG instruction cannot be executed at the virtual-8086 mode.

64-Bit Mode Exceptions

#GP(0) If the current privilege level is not 0.
#UD Operand is a register.
 If the LOCK prefix is used.

INVPCID—Invalidate Process-Context Identifier

| Opcode/Instruction | Op/En | 64/32-bit Mode | CPUID Feature Flag | Description |
|-------------------------------------|-------|----------------|--------------------|---|
| 66 0F 38 82 /r INVPCID r32, m128 | RM | N.E./V | INVPCID | Invalidates entries in the TLBs and paging-structure caches based on invalidation type in r32 and descriptor in m128. |
| 66 0F 38 82 /r INVPCID r64, m128 | RM | V/N.E. | INVPCID | Invalidates entries in the TLBs and paging-structure caches based on invalidation type in r64 and descriptor in m128. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|-----------|-----------|
| RM | ModRM:reg (r) | ModRM:r/m (r) | N/A | N/A |

Description

Invalidates mappings in the translation lookaside buffers (TLBs) and paging-structure caches based on process-context identifier (PCID). (See Section 5.10, “Caching Translation Information,” in the *Intel 64 and IA-32 Architecture Software Developer’s Manual, Volume 3A*.) Invalidation is based on the INVPCID type specified in the register operand and the INVPCID descriptor specified in the memory operand.

Outside 64-bit mode, the register operand is always 32 bits, regardless of the value of CS.D. In 64-bit mode the register operand has 64 bits.

There are four INVPCID types currently defined:

- Individual-address invalidation: If the INVPCID type is 0, the logical processor invalidates mappings—except global translations—for the linear address and PCID specified in the INVPCID descriptor.¹ In some cases, the instruction may invalidate global translations or mappings for other linear addresses (or other PCIDs) as well.
- Single-context invalidation: If the INVPCID type is 1, the logical processor invalidates all mappings—except global translations—associated with the PCID specified in the INVPCID descriptor. In some cases, the instruction may invalidate global translations or mappings for other PCIDs as well.
- All-context invalidation, including global translations: If the INVPCID type is 2, the logical processor invalidates all mappings—including global translations—associated with any PCID.
- All-context invalidation: If the INVPCID type is 3, the logical processor invalidates all mappings—except global translations—associated with any PCID. In some case, the instruction may invalidate global translations as well.

The INVPCID descriptor comprises 128 bits and consists of a PCID and a linear address as shown in Figure 3-25. For INVPCID type 0, the processor uses the full 64 bits of the linear address even outside 64-bit mode; the linear address is not used for other INVPCID types.

Figure 3-25. INVPCID Descriptor

1. If the paging structures map the linear address using a page larger than 4 KBytes and there are multiple TLB entries for that page (see Section 5.10.2.3, “Details of TLB Use,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A), the instruction invalidates all of them.

If CR4.PCIDE = 0, a logical processor does not cache information for any PCID other than 000H. In this case, executions with INVPCID types 0 and 1 are allowed only if the PCID specified in the INVPCID descriptor is 000H; executions with INVPCID types 2 and 3 invalidate mappings only for PCID 000H. Note that CR4.PCIDE must be 0 outside IA-32e mode (see Section 5.10.1, “Process-Context Identifiers (PCIDs),” of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A).

Operation

```
INVPCID_TYPE := value of register operand;      // must be in the range of 0-3
INVPCID_DESC := value of memory operand;
CASE INVPCID_TYPE OF
  0:      // individual-address invalidation
    PCID := INVPCID_DESC[11:0];
    L_ADDR := INVPCID_DESC[127:64];
    Invalidate mappings for L_ADDR associated with PCID except global translations;
    BREAK;
  1:      // single PCID invalidation
    PCID := INVPCID_DESC[11:0];
    Invalidate all mappings associated with PCID except global translations;
    BREAK;
  2:      // all PCID invalidation including global translations
    Invalidate all mappings for all PCIDs, including global translations;
    BREAK;
  3:      // all PCID invalidation retaining global translations
    Invalidate all mappings for all PCIDs except global translations;
    BREAK;
ESAC;
```

Intel C/C++ Compiler Intrinsic Equivalent

```
INVPCID void _invpcid(unsigned __int32 type, void * descriptor);
```

SIMD Floating-Point Exceptions

None.

Protected Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | <p>If the current privilege level is not 0.</p> <p>If the memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.</p> <p>If the DS, ES, FS, or GS register contains an unusable segment.</p> <p>If the source operand is located in an execute-only code segment.</p> <p>If an invalid type is specified in the register operand, i.e., INVPCID_TYPE > 3.</p> <p>If bits 63:12 of INVPCID_DESC are not all zero.</p> <p>If INVPCID_TYPE is either 0 or 1 and INVPCID_DESC[11:0] is not zero.</p> <p>If INVPCID_TYPE is 0 and the linear address in INVPCID_DESC[127:64] is not canonical.</p> |
| #PF(fault-code) | If a page fault occurs in accessing the memory operand. |
| #SS(0) | <p>If the memory operand effective address is outside the SS segment limit.</p> <p>If the SS register contains an unusable segment.</p> |
| #UD | <p>If if CPUID.(EAX=07H, ECX=0H):EBX.INVPCID[bit 10] = 0.</p> <p>If the LOCK prefix is used.</p> |

Real-Address Mode Exceptions

| | |
|-----|--|
| #GP | If an invalid type is specified in the register operand, i.e., INVPCID_TYPE > 3. If bits 63:12 of INVPCID_DESC are not all zero. If INVPCID_TYPE is either 0 or 1 and INVPCID_DESC[11:0] is not zero. If INVPCID_TYPE is 0 and the linear address in INVPCID_DESC[127:64] is not canonical. |
| #UD | If CPUID.(EAX=07H, ECX=0H):EBX.INVPCID[bit 10] = 0. If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|--------|---|
| #GP(0) | The INVPCID instruction is not recognized in virtual-8086 mode. |
|--------|---|

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If the current privilege level is not 0. If the memory operand is in the CS, DS, ES, FS, or GS segments and the memory address is in a non-canonical form. If an invalid type is specified in the register operand, i.e., INVPCID_TYPE > 3. If bits 63:12 of INVPCID_DESC are not all zero. If CR4.PCIDE=0, INVPCID_TYPE is either 0 or 1, and INVPCID_DESC[11:0] is not zero. If INVPCID_TYPE is 0 and the linear address in INVPCID_DESC[127:64] is not canonical. |
| #PF(fault-code) | If a page fault occurs in accessing the memory operand. |
| #SS(0) | If the memory destination operand is in the SS segment and the memory address is in a non-canonical form. |
| #UD | If the LOCK prefix is used. If CPUID.(EAX=07H, ECX=0H):EBX.INVPCID[bit 10] = 0. |

IRET/IRETD/IRETQ—Interrupt Return

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|------------|-------------|-------|-------------|-----------------|---|
| CF | IRET | Z0 | Valid | Valid | Interrupt return (16-bit operand size). |
| CF | IRETD | Z0 | Valid | Valid | Interrupt return (32-bit operand size). |
| REX.W + CF | IRETQ | Z0 | Valid | N.E. | Interrupt return (64-bit operand size). |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Returns program control from an exception or interrupt handler to a program or procedure that was interrupted by an exception, an external interrupt, or a software-generated interrupt. These instructions are also used to perform a return from a nested task. (A nested task is created when a CALL instruction is used to initiate a task switch or when an interrupt or exception causes a task switch to an interrupt or exception handler.) See the section titled “Task Linking” in Chapter 9 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A.

IRET and IRETD are mnemonics for the same opcode. The IRETD mnemonic (interrupt return double) is intended for use when returning from an interrupt when using the 32-bit operand size; however, most assemblers use the IRET mnemonic interchangeably for both operand sizes.

In Real-Address Mode, the IRET instruction performs a far return to the interrupted program or procedure. During this operation, the processor pops the return instruction pointer, return code segment selector, and EFLAGS image from the stack to the EIP, CS, and EFLAGS registers, respectively, and then resumes execution of the interrupted program or procedure.

In Protected Mode, the action of the IRET instruction depends on the settings of the NT (nested task) and VM flags in the EFLAGS register and the VM flag in the EFLAGS image stored on the current stack. Depending on the setting of these flags, the processor performs the following types of interrupt returns:

- Return from virtual-8086 mode.
- Return to virtual-8086 mode.
- Intra-privilege level return.
- Inter-privilege level return.
- Return from nested task (task switch).

If the NT flag (EFLAGS register) is cleared, the IRET instruction performs a far return from the interrupt procedure, without a task switch. The code segment being returned to must be equally or less privileged than the interrupt handler routine (as indicated by the RPL field of the code segment selector popped from the stack).

As with a real-address mode interrupt return, the IRET instruction pops the return instruction pointer, return code segment selector, and EFLAGS image from the stack to the EIP, CS, and EFLAGS registers, respectively, and then resumes execution of the interrupted program or procedure. If the return is to another privilege level, the IRET instruction also pops the stack pointer and SS from the stack, before resuming program execution. If the return is to virtual-8086 mode, the processor also pops the data segment registers from the stack.

If the NT flag is set, the IRET instruction performs a task switch (return) from a nested task (a task called with a CALL instruction, an interrupt, or an exception) back to the calling or interrupted task. The updated state of the task executing the IRET instruction is saved in its TSS. If the task is re-entered later, the code that follows the IRET instruction is executed.

If the NT flag is set and the processor is in IA-32e mode, the IRET instruction causes a general protection exception.

If nonmaskable interrupts (NMIs) are blocked (see Section 7.7.1, “Handling Multiple NMIs” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A), execution of the IRET instruction unblocks NMIs.

This unblocking occurs even if the instruction causes a fault. In such a case, NMIs are unmasked before the exception handler is invoked.

In 64-bit mode, the instruction's default operation size is 32 bits. Use of the REX.W prefix promotes operation to 64 bits (IRETQ). See the summary chart at the beginning of this section for encoding data and limits.

Refer to Chapter 6, "Procedure Calls, Interrupts, and Exceptions" and Chapter 18, "Control-flow Enforcement Technology (CET)" in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, for CET details.

Instruction ordering. IRET is a serializing instruction. See Section 10.3 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A.

See "Changes to Instruction Behavior in VMX Non-Root Operation" in Chapter 26 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C, for more information about the behavior of this instruction in VMX non-root operation.

Flags Affected

All the flags and fields in the EFLAGS register are potentially modified, depending on the mode of operation of the processor. If performing a return from a nested task to a previous task, the EFLAGS register will be modified according to the EFLAGS image stored in the previous task's TSS.

Protected Mode Exceptions

| | |
|--------------------|--|
| #GP(0) | If the return code or stack segment selector is NULL. If the return instruction pointer is not within the return code segment limit. |
| #GP(selector) | If a segment selector index is outside its descriptor table limits. If the return code segment selector RPL is less than the CPL. If the DPL of a conforming-code segment is greater than the return code segment selector RPL. If the DPL for a nonconforming-code segment is not equal to the RPL of the code segment selector. If the stack segment descriptor DPL is not equal to the RPL of the return code segment selector. If the stack segment is not a writable data segment. If the stack segment selector RPL is not equal to the RPL of the return code segment selector. If the segment descriptor for a code segment does not indicate it is a code segment. If the segment selector for a TSS has its local/global bit set for local. If a TSS segment descriptor specifies that the TSS is not busy. If a TSS segment descriptor specifies that the TSS is not available. |
| #SS(0) | If the top bytes of stack are not within stack limits. If the return stack segment is not present. |
| #NP (selector) | If the return code segment is not present. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If an unaligned memory reference occurs when the CPL is 3 and alignment checking is enabled. |
| #UD | If the LOCK prefix is used. |
| #CP (Far-RET/IRET) | If the previous SSP from shadow stack (when returning to CPL <3) or from IA32_PL3_SSP (returning to CPL 3) is not 4 byte aligned. If returning to 32-bit or compatibility mode and the previous SSP from shadow stack (when returning to CPL <3) or from IA32_PL3_SSP (returning to CPL 3) is beyond 4GB. If return instruction pointer from stack and shadow stack do not match. |

Real-Address Mode Exceptions

| | |
|-----|--|
| #GP | If the return instruction pointer is not within the return code segment limit. |
| #SS | If the top bytes of stack are not within stack limits. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If the return instruction pointer is not within the return code segment limit. If IOPL not equal to 3. |
| #PF(fault-code) | If a page fault occurs. |
| #SS(0) | If the top bytes of stack are not within stack limits. |
| #AC(0) | If an unaligned memory reference occurs and alignment checking is enabled. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

#GP(0) If EFLAGS.NT[bit 14] = 1.
Other exceptions same as in Protected Mode.

64-Bit Mode Exceptions

#GP(0) If EFLAGS.NT[bit 14] = 1.
If the return code segment selector is NULL.
If the stack segment selector is NULL going back to compatibility mode.
If the stack segment selector is NULL going back to CPL3 64-bit mode.
If a NULL stack segment selector RPL is not equal to CPL going back to non-CPL3 64-bit mode.
If the return instruction pointer is not within the return code segment limit.
If the return instruction pointer is non-canonical.

#GP(Selector) If a segment selector index is outside its descriptor table limits.
If a segment descriptor memory address is non-canonical.
If the segment descriptor for a code segment does not indicate it is a code segment.
If the proposed new code segment descriptor has both the D-bit and L-bit set.
If the DPL for a nonconforming-code segment is not equal to the RPL of the code segment selector.
If CPL is greater than the RPL of the code segment selector.
If the DPL of a conforming-code segment is greater than the return code segment selector RPL.
If the stack segment is not a writable data segment.
If the stack segment descriptor DPL is not equal to the RPL of the return code segment selector.
If the stack segment selector RPL is not equal to the RPL of the return code segment selector.

#SS(0) If an attempt to pop a value off the stack violates the SS limit.
If an attempt to pop a value off the stack causes a non-canonical address to be referenced.
If the return stack segment is not present.

#NP (selector) If the return code segment is not present.

#PF(fault-code) If a page fault occurs.

#AC(0) If an unaligned memory reference occurs when the CPL is 3 and alignment checking is enabled.

#UD If the LOCK prefix is used.

#CP (Far-RET/IRET) If the previous SSP from shadow stack (when returning to CPL <3) or from IA32_PL3_SSP (returning to CPL 3) is not 4 byte aligned.
If returning to 32-bit or compatibility mode and the previous SSP from shadow stack (when returning to CPL <3) or from IA32_PL3_SSP (returning to CPL 3) is beyond 4GB.
If return instruction pointer from stack and shadow stack do not match.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| D | Offset | N/A | N/A | N/A |

Description

Checks the state of one or more of the status flags in the EFLAGS register (CF, OF, PF, SF, and ZF) and, if the flags are in the specified state (condition), performs a jump to the target instruction specified by the destination operand. A condition code (*cc*) is associated with each instruction to indicate the condition being tested for. If the condition is not satisfied, the jump is not performed and execution continues with the instruction following the *Jcc* instruction.

The target instruction is specified with a relative offset (a signed offset relative to the current value of the instruction pointer in the EIP register). A relative offset (*rel8*, *rel16*, or *rel32*) is generally specified as a label in assembly code, but at the machine code level, it is encoded as a signed, 8-bit or 32-bit immediate value, which is added to the instruction pointer. Instruction coding is most efficient for offsets of -128 to +127. If the operand-size attribute is 16, the upper two bytes of the EIP register are cleared, resulting in a maximum instruction pointer size of 16 bits.

The conditions for each *Jcc* mnemonic are given in the “Description” column of the table on the preceding page. The terms “less” and “greater” are used for comparisons of signed integers and the terms “above” and “below” are used for unsigned integers.

Because a particular state of the status flags can sometimes be interpreted in two ways, two mnemonics are defined for some opcodes. For example, the *JA* (jump if above) instruction and the *JNBE* (jump if not below or equal) instruction are alternate mnemonics for the opcode 77H.

The *Jcc* instruction does not support far jumps (jumps to other code segments). When the target for the conditional jump is in a different segment, use the opposite condition from the condition being tested for the *Jcc* instruction, and then access the target with an unconditional far jump (*JMP* instruction) to the other segment. For example, the following conditional far jump is illegal:

```
JZ FARLABEL;
```

To accomplish this far jump, use the following two instructions:

```
JNZ BEYOND;
JMP FARLABEL;
BEYOND:
```

The *JRCXZ*, *JECXZ*, and *JCXZ* instructions differ from other *Jcc* instructions because they do not check status flags. Instead, they check RCX, ECX or CX for 0. The register checked is determined by the address-size attribute. These instructions are useful when used at the beginning of a loop that terminates with a conditional loop instruction (such as *LOOPNE*). They can be used to prevent an instruction sequence from entering a loop when RCX, ECX or CX is 0. This would cause the loop to execute 2^{64} , 2^{32} or 64K times (not zero times).

All conditional jumps are converted to code fetches of one or two cache lines, regardless of jump address or cache-ability.

In 64-bit mode, operand size is fixed at 64 bits. *JMP* Short is $RIP = RIP + 8\text{-bit offset sign extended to 64 bits}$. *JMP* Near is $RIP = RIP + 32\text{-bit offset sign extended to 64 bits}$.

Operation

```
IF condition
  THEN
    tempEIP := EIP + SignExtend(DEST);
    IF OperandSize = 16
      THEN tempEIP := tempEIP AND 0000FFFFH;
    FI;
  IF tempEIP is not within code segment limit
    THEN #GP(0);
  ELSE EIP := tempEIP
  FI;
FI;
```

Flags Affected

None.

Protected Mode Exceptions

| | |
|--------|---|
| #GP(0) | If the offset being jumped to is beyond the limits of the CS segment. |
| #UD | If the LOCK prefix is used. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If the offset being jumped to is beyond the limits of the CS segment or is outside of the effective address space from 0 to FFFFH. This condition can occur if a 32-bit address size override prefix is used. |
| #UD | If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

Same exceptions as in real address mode.

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|--------|---|
| #GP(0) | If the memory address is in a non-canonical form. |
| #UD | If the LOCK prefix is used. |

JMP—Jump

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|-------------|--------------|-------|-------------|-----------------|---|
| EB cb | JMP rel8 | D | Valid | Valid | Jump short, RIP = RIP + 8-bit displacement sign extended to 64-bits. |
| E9 cw | JMP rel16 | D | N.S. | Valid | Jump near, relative, displacement relative to next instruction. Not supported in 64-bit mode. |
| E9 cd | JMP rel32 | D | Valid | Valid | Jump near, relative, RIP = RIP + 32-bit displacement sign extended to 64-bits. |
| FF /4 | JMP r/m16 | M | N.S. | Valid | Jump near, absolute indirect, address = zero-extended r/m16. Not supported in 64-bit mode. |
| FF /4 | JMP r/m32 | M | N.S. | Valid | Jump near, absolute indirect, address given in r/m32. Not supported in 64-bit mode. |
| FF /4 | JMP r/m64 | M | Valid | N.E. | Jump near, absolute indirect, RIP = 64-Bit offset from register or memory. |
| EA cd | JMP ptr16:16 | S | Inv. | Valid | Jump far, absolute, address given in operand. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|----------------------------|-----------|-----------|-----------|
| S | Segment + Absolute Address | N/A | N/A | N/A |
| D | Offset | N/A | N/A | N/A |
| M | ModRM:r/m (r) | N/A | N/A | N/A |

Description

Transfers program control to a different point in the instruction stream without recording return information. The destination (target) operand specifies the address of the instruction being jumped to. This operand can be an immediate value, a general-purpose register, or a memory location.

This instruction can be used to execute four different types of jumps:

- Near jump—A jump to an instruction within the current code segment (the segment currently pointed to by the CS register), sometimes referred to as an intrasegment jump.
- Short jump—A near jump where the jump range is limited to –128 to +127 from the current EIP value.
- Far jump—A jump to an instruction located in a different segment than the current code segment but at the same privilege level, sometimes referred to as an intersegment jump.
- Task switch—A jump to an instruction located in a different task.

A task switch can only be executed in protected mode (see Chapter 9, in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A, for information on performing task switches with the JMP instruction).

Near and Short Jumps. When executing a near jump, the processor jumps to the address (within the current code segment) that is specified with the target operand. The target operand specifies either an absolute offset (that is an offset from the base of the code segment) or a relative offset (a signed displacement relative to the current

value of the instruction pointer in the EIP register). A near jump to a relative offset of 8-bits (*rel8*) is referred to as a short jump. The CS register is not changed on near and short jumps.

An absolute offset is specified indirectly in a general-purpose register or a memory location (*r/m16* or *r/m32*). The operand-size attribute determines the size of the target operand (16 or 32 bits). Absolute offsets are loaded directly into the EIP register. If the operand-size attribute is 16, the upper two bytes of the EIP register are cleared, resulting in a maximum instruction pointer size of 16 bits.

A relative offset (*rel8*, *rel16*, or *rel32*) is generally specified as a label in assembly code, but at the machine code level, it is encoded as a signed 8-, 16-, or 32-bit immediate value. This value is added to the value in the EIP register. (Here, the EIP register contains the address of the instruction following the JMP instruction). When using relative offsets, the opcode (for short vs. near jumps) and the operand-size attribute (for near relative jumps) determines the size of the target operand (8, 16, or 32 bits).

Far Jumps in Real-Address or Virtual-8086 Mode. When executing a far jump in real-address or virtual-8086 mode, the processor jumps to the code segment and offset specified with the target operand. Here the target operand specifies an absolute far address either directly with a pointer (*ptr16:16* or *ptr16:32*) or indirectly with a memory location (*m16:16* or *m16:32*). With the pointer method, the segment and address of the called procedure is encoded in the instruction, using a 4-byte (16-bit operand size) or 6-byte (32-bit operand size) far address immediate. With the indirect method, the target operand specifies a memory location that contains a 4-byte (16-bit operand size) or 6-byte (32-bit operand size) far address. The far address is loaded directly into the CS and EIP registers. If the operand-size attribute is 16, the upper two bytes of the EIP register are cleared.

Far Jumps in Protected Mode. When the processor is operating in protected mode, the JMP instruction can be used to perform the following three types of far jumps:

- A far jump to a conforming or non-conforming code segment.
- A far jump through a call gate.
- A task switch.

(The JMP instruction cannot be used to perform inter-privilege-level far jumps.)

In protected mode, the processor always uses the segment selector part of the far address to access the corresponding descriptor in the GDT or LDT. The descriptor type (code segment, call gate, task gate, or TSS) and access rights determine the type of jump to be performed.

If the selected descriptor is for a code segment, a far jump to a code segment at the same privilege level is performed. (If the selected code segment is at a different privilege level and the code segment is non-conforming, a general-protection exception is generated.) A far jump to the same privilege level in protected mode is very similar to one carried out in real-address or virtual-8086 mode. The target operand specifies an absolute far address either directly with a pointer (*ptr16:16* or *ptr16:32*) or indirectly with a memory location (*m16:16* or *m16:32*). The operand-size attribute determines the size of the offset (16 or 32 bits) in the far address. The new code segment selector and its descriptor are loaded into CS register, and the offset from the instruction is loaded into the EIP register. Note that a call gate (described in the next paragraph) can also be used to perform far call to a code segment at the same privilege level. Using this mechanism provides an extra level of indirection and is the preferred method of making jumps between 16-bit and 32-bit code segments.

When executing a far jump through a call gate, the segment selector specified by the target operand identifies the call gate. (The offset part of the target operand is ignored.) The processor then jumps to the code segment specified in the call gate descriptor and begins executing the instruction at the offset specified in the call gate. No stack switch occurs. Here again, the target operand can specify the far address of the call gate either directly with a pointer (*ptr16:16* or *ptr16:32*) or indirectly with a memory location (*m16:16* or *m16:32*).

Executing a task switch with the JMP instruction is somewhat similar to executing a jump through a call gate. Here the target operand specifies the segment selector of the task gate for the task being switched to (and the offset part of the target operand is ignored). The task gate in turn points to the TSS for the task, which contains the segment selectors for the task's code and stack segments. The TSS also contains the EIP value for the next instruction that was to be executed before the task was suspended. This instruction pointer value is loaded into the EIP register so that the task begins executing again at this next instruction.

The JMP instruction can also specify the segment selector of the TSS directly, which eliminates the indirection of the task gate. See Chapter 9 in Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A, for detailed information on the mechanics of a task switch.

Note that when you execute at task switch with a JMP instruction, the nested task flag (NT) is not set in the EFLAGS register and the new TSS's previous task link field is not loaded with the old task's TSS selector. A return to the previous task can thus not be carried out by executing the IRET instruction. Switching tasks with the JMP instruction differs in this regard from the CALL instruction which does set the NT flag and save the previous task link information, allowing a return to the calling task with an IRET instruction.

Refer to Chapter 6, "Procedure Calls, Interrupts, and Exceptions" and Chapter 18, "Control-flow Enforcement Technology (CET)" in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, for CET details.

In 64-Bit Mode. The instruction's operation size is fixed at 64 bits. If a selector points to a gate, then RIP equals the 64-bit displacement taken from gate; else RIP equals the zero-extended offset from the far pointer referenced in the instruction.

See the summary chart at the beginning of this section for encoding data and limits.

Instruction ordering. Instructions following a far jump may be fetched from memory before earlier instructions complete execution, but they will not execute (even speculatively) until all instructions prior to the far jump have completed execution (the later instructions may execute before data stored by the earlier instructions have become globally visible).

Instructions sequentially following a near indirect JMP instruction (i.e., those not at the target) may be executed speculatively. If software needs to prevent this (e.g., in order to prevent a speculative execution side channel), then an INT3 or LFENCE instruction opcode can be placed after the near indirect JMP in order to block speculative execution.

Operation

```

IF near jump
  IF 64-bit Mode

|-------|--|--|
| RM | ModRM:reg (w) | ModRM:r/m (r) |
| MR | ModRM:r/m (w, ModRM:[7:6] must not be 11b) | ModRM:reg (r) |
| RR | ModRM:reg (w) | ModRM:r/m (r, ModRM:[7:6] must be 11b) |

Description

Copies values from the source operand (second operand) to the destination operand (first operand). The source and destination operands can be mask registers, memory location or general purpose. The instruction cannot be used to transfer data between general purpose registers and or memory locations.

When moving to a mask register, the result is zero extended to MAX_KL size (i.e., 64 bits currently). When moving to a general-purpose register (GPR), the result is zero-extended to the size of the destination. In 32-bit mode, the default GPR destination's size is 32 bits. In 64-bit mode, the default GPR destination's size is 64 bits. Note that VEX.W can only be used to modify the size of the GPR operand in 64b mode.

Operation

KMOVW

IF *destination is a memory location*

DEST[15:0] := SRC[15:0]

IF *destination is a mask register or a GPR *

DEST := ZeroExtension(SRC[15:0])

KMOVB

IF *destination is a memory location*

DEST[7:0] := SRC[7:0]

IF *destination is a mask register or a GPR *

DEST := ZeroExtension(SRC[7:0])

KMOVQ

IF *destination is a memory location or a GPR*

DEST[63:0] := SRC[63:0]

IF *destination is a mask register*

DEST := ZeroExtension(SRC[63:0])

KMOVD

IF *destination is a memory location*

DEST[31:0] := SRC[31:0]

IF *destination is a mask register or a GPR *

DEST := ZeroExtension(SRC[31:0])

Intel C/C++ Compiler Intrinsic Equivalent

| VEEX.L0.66.0F3A.W0 33 /r KSHIFTLD k1, k2, imm8 | RRI | V/V | AVX512BW OR AVX10.1 | Shift left 32 bits in k2 by immediate and write result in k1. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 |
|-------|---------------|--|-----------|
| RRI | ModRM:reg (w) | ModRM:r/m (r, ModRM:[7:6] must be 11b) | imm8 |

Description

Shifts 8/16/32/64 bits in the second operand (source operand) left by the count specified in immediate byte and place the least significant 8/16/32/64 bits of the result in the destination operand. The higher bits of the destination are zero-extended. The destination is set to zero if the count value is greater than 7 (for byte shift), 15 (for word shift), 31 (for doubleword shift) or 63 (for quadword shift).

Operation

KSHIFTLW

```
COUNT := imm8[7:0]
DEST[MAX_KL-1:0] := 0
IF COUNT <= 15
    THEN DEST[15:0] := SRC1[15:0] << COUNT;
FI;
```

KSHIFTLB

```

KSHIFTRW/KSHIFTRB/KSHIFTRQ/KSHIFTRD—Shift Right Mask Registers

| Opcode/ Instruction | Op/En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|--|-------|------------------------------|------------------------|--|
| VEX.L0.66.0F3A.W1 30 /r KSHIFTRW k1, k2, imm8 | RRI | V/V | AVX512F OR AVX10.1 | Shift right 16 bits in k2 by immediate and write result in k1. |
| VEX.L0.66.0F3A.W0 30 /r KSHIFTRB k1, k2, imm8 | RRI | V/V | AVX512DQ OR AVX10.1 | Shift right 8 bits in k2 by immediate and write result in k1. |
| VEX.L0.66.0F3A.W1 31 /r KSHIFTRQ k1, k2, imm8 | RRI | V/V | AVX512BW OR AVX10.1 | Shift right 64 bits in k2 by immediate and write result in k1. |
| VEX.L0.66.0F3A.W0 31 /r KSHIFTRD k1, k2, imm8 | RRI | V/V | AVX512BW OR AVX10.1 | Shift right 32 bits in k2 by immediate and write result in k1. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 |
|-------|---------------|--|-----------|
| RRI | ModRM:reg (w) | ModRM:r/m (r, ModRM:[7:6] must be 11b) | imm8 |

Description

Shifts 8/16/32/64 bits in the second operand (source operand) right by the count specified in immediate and place the least significant 8/16/32/64 bits of the result in the destination operand. The higher bits of the destination are zero-extended. The destination is set to zero if the count value is greater than 7 (for byte shift), 15 (for word shift), 31 (for doubleword shift) or 63 (for quadword shift).

Operation

KSHIFTRW

```
COUNT := imm8[7:0]
DEST[MAX_KL-1:0] := 0
IF COUNT <= 15
    THEN DEST[15:0] := SRC1[15:0] >> COUNT;
FI;
```

KSHIFTRB

```
COUNT := imm8[7:0]
DEST[MAX_KL-1:0] := 0
IF COUNT <= 7
    THEN DEST[7:0] := SRC1[7:0] >> COUNT;
FI;
```

KSHIFTRQ

```
COUNT := imm8[7:0]
DEST[MAX_KL-1:0] := 0
IF COUNT <= 63
    THEN DEST[63:0] := SRC1[63:0] >> COUNT;
FI;
```

KSHIFTRD

```
COUNT := imm8[7:0]
DEST[MAX_KL-1:0] := 0
IF COUNT <= 31
    THEN    DEST[31:0] := SRC1[31:0] >> COUNT;
FI;
```

KTESTW/KTESTB/KTESTQ/KTESTD—Packed Bit Test Masks and Set Flags

| Opcode/ Instruction | Op En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|--|----------|------------------------------|------------------------|--|
| VEX.L0.0F.W0 99 /r KTESTW k1, k2 | RR | V/V | AVX512DQ OR AVX10.1 | Set ZF and CF depending on sign bit AND and ANDN of 16 bits mask register sources. |
| VEX.L0.66.0F.W0 99 /r KTESTB k1, k2 | RR | V/V | AVX512DQ OR AVX10.1 | Set ZF and CF depending on sign bit AND and ANDN of 8 bits mask register sources. |
| VEX.L0.0F.W1 99 /r KTESTQ k1, k2 | RR | V/V | AVX512BW OR AVX10.1 | Set ZF and CF depending on sign bit AND and ANDN of 64 bits mask register sources. |
| VEX.L0.66.0F.W1 99 /r KTESTD k1, k2 | RR | V/V | AVX512BW OR AVX10.1 | Set ZF and CF depending on sign bit AND and ANDN of 32 bits mask register sources. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 |
|-------|---------------|--|
| RR | ModRM:reg (r) | ModRM:r/m (r, ModRM:[7:6] must be 11b) |

Description

Performs a bitwise comparison of the bits of the first source operand and corresponding bits in the second source operand. If the AND operation produces all zeros, the ZF is set else the ZF is clear. If the bitwise AND operation of the inverted first source operand with the second source operand produces all zeros the CF is set else the CF is clear. Only the EFLAGS register is updated.

Note: In VEX-encoded versions, VEX.vvvv is reserved and must be 1111b, otherwise instructions will #UD.

LAR—Load Access Rights

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|-----------------|-------------------------------|-------|-------------|-----------------|---|
| OF 02 /r | LAR r16, r16/m16 | RM | Valid | Valid | Load access rights from specified descriptor. |
| OF 02 /r | LAR r32, r32/m16 ¹ | RM | Valid | Valid | Load access rights from specified descriptor. |
| REX.W + OF 02/r | LAR r32, r64/m16 ¹ | RM | Valid | N.E. | Load access rights from specified descriptor. |

NOTES:

1. Regardless of operand size, only bits 15:0 of a register source operand are used. Other bits are ignored.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|-----------|-----------|
| RM | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Loads the access rights from the segment descriptor specified by the second operand (source operand) into the first operand (destination operand) and sets the ZF flag in the EFLAGS register. The source operand (which can be a register or a memory location) contains the segment selector for the segment descriptor being accessed. If the source operand is a memory address, only 16 bits of data are accessed. The destination operand is a general-purpose register.

The processor performs access checks as part of the loading process. Once loaded in the destination register, software can perform additional checks on the access rights information.

The access rights for a segment descriptor include fields located in the second doubleword (bytes 4–7) of the segment descriptor. The following fields are loaded by the LAR instruction:

- Bits 7:0 are returned as 0
- Bits 11:8 return the segment type.
- Bit 12 returns the S flag.
- Bits 14:13 return the DPL.
- Bit 15 returns the P flag.
- The following fields are returned only if the operand size is greater than 16 bits:
 - Bits 19:16 are undefined.
 - Bit 20 returns the software-available bit in the descriptor.
 - Bit 21 returns the L flag.
 - Bit 22 returns the D/B flag.
 - Bit 23 returns the G flag.
 - Bits 31:24 are returned as 0.

When the operand size is 16 bits, only the low 16 bits identified above are returned; the upper bits of the destination are unmodified. When the operand size is 32 bits, the 32-bit value identified above is loaded into the destination operand; the upper bits of the destination are cleared. When the operand is 64 bits, the 32-bit value is zero-extended to 64 bits and loaded into the destination operand. (The behavior with 32-bit and 64-bit operand sizes is identical.)

This instruction performs the following checks before it loads the access rights in the destination register:

- Checks that the segment selector is not NULL.
- Checks that the segment selector points to a descriptor that is within the limits of the GDT or LDT being accessed

- Checks that the descriptor type is valid for this instruction. All code and data segment descriptors are valid for (can be accessed with) the LAR instruction. The valid system segment and gate descriptor types are given in Table 3-62.
- If the segment is not a conforming code segment, it checks that the specified segment descriptor is visible at the CPL (that is, if the CPL and the RPL of the segment selector are less than or equal to the DPL of the segment selector).

If the segment descriptor cannot be accessed or is an invalid type for the instruction, the ZF flag is cleared and no access rights are loaded in the destination operand.

The LAR instruction can only be executed in protected mode and IA-32e mode.

Table 3-62. Segment and Gate Types

| Type | Protected Mode | | IA-32e Mode | |
|------|-------------------------|-------|-----------------------|-------|
| | Name | Valid | Name | Valid |
| 0 | Reserved | No | Reserved | No |
| 1 | Available 16-bit TSS | Yes | Reserved | No |
| 2 | LDT | Yes | LDT | Yes |

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If the memory operand effective address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory operand effective address is in a non-canonical form. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and the memory operand effective address is unaligned while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

LDDQU—Load Unaligned Integer 128 Bits

| Opcode/ Instruction | Op/ En | 64/32-bit Mode | CPUID Feature Flag | Description |
|--|-----------|-------------------|--------------------------|--|
| F2 0F F0 /r LDDQU xmm1, mem | RM | V/V | SSE3 | Load unaligned data from mem and return double quadword in xmm1. |
| VEX.128.F2.0F.WIG F0 /r VLDDQU xmm1, m128 | RM | V/V | AVX | Load unaligned packed integer values from mem to xmm1. |
| VEX.256.F2.0F.WIG F0 /r VLDDQU ymm1, m256 | RM | V/V | AVX | Load unaligned packed integer values from mem to ymm1. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|-----------|-----------|
| RM | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

The instruction is *functionally similar* to (V)MOVDQU ymm/xmm, m256/m128 for loading from memory. That is: 32/16 bytes of data starting at an address specified by the source memory operand (second operand) are fetched from memory and placed in a destination register (first operand). The source operand need not be aligned on a 32/16-byte boundary. Up to 64/32 bytes may be loaded from memory; this is implementation dependent.

This instruction may improve performance relative to (V)MOVDQU if the source operand crosses a cache line boundary. In situations that require the data loaded by (V)LDDQU be modified and stored to the same location, use (V)MOVDQU or (V)MOVDQA instead of (V)LDDQU. To move a double quadword to or from memory locations that are known to be aligned on 16-byte boundaries, use the (V)MOVDQA instruction.

Implementation Notes

- If the source is aligned to a 32/16-byte boundary, based on the implementation, the 32/16 bytes may be loaded more than once. For that reason, the usage of (V)LDDQU should be avoided when using uncached or write-combining (WC) memory regions. For uncached or WC memory regions, keep using (V)MOVDQU.
- This instruction is a replacement for (V)MOVDQU (load) in situations where cache line splits significantly affect performance. It should not be used in situations where store-load forwarding is performance critical. If performance of store-load forwarding is critical to the application, use (V)MOVDQA store-load pairs when data is 256/128-bit aligned or (V)MOVDQU store-load pairs when data is 256/128-bit unaligned.
- If the memory address is not aligned on 32/16-byte boundary, some implementations may load up to 64/32 bytes and return 32/16 bytes in the destination. Some processor implementations may issue multiple loads to access the appropriate 32/16 bytes. Developers of multi-threaded or multi-processor software should be aware that on these processors the loads will be performed in a non-atomic way.
- If alignment checking is enabled (CR0.AM = 1, RFLAGS.AC = 1, and CPL = 3), an alignment-check exception (#AC) may or may not be generated (depending on processor implementation) when the memory address is not aligned on an 8-byte boundary.

In 64-bit mode, use of the REX.R prefix permits this instruction to access additional registers (XMM8-XMM15).

Note: In VEX-encoded versions, VEX.vvvv is reserved and must be 1111b otherwise instructions will #UD.

Operation

LDDQU (128-bit Legacy SSE Version)

DEST[127:0] := SRC[127:0]

DEST[MAXVL-1:128] (Unmodified)

VLDDQU (VEX.128 Encoded Version)

DEST[127:0] := SRC[127:0]

Note treatment of #AC varies.

LDMXCSR—Load MXCSR Register

| Opcode/ Instruction | Op/ En | 64/32-bit Mode | CPUID Feature Flag | Description |
|-------------------------------------|-----------|-------------------|--------------------------|-------------------------------|
| NP OF AE /2 LDMXCSR m32 | M | V/V | SSE | Load MXCSR register from m32. |
| VEX.LZ.OF.WIG AE /2 VLDMXCSR m32 | M | V/V | AVX | Load MXCSR register from m32. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|-----------|-----------|-----------|
| M | ModRM:r/m (r) | N/A | N/A | N/A |

Description

Loads the source operand into the MXCSR control/status register. The source operand is a 32-bit memory location. See “MXCSR Control and Status Register” in Chapter 10, of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1, for a description of the MXCSR register and its contents.

The LDMXCSR instruction is typically used in conjunction with the (V)STMXCSR instruction, which stores the contents of the MXCSR register in memory.

The default MXCSR value at reset is 1F80H.

If a (V)LDMXCSR instruction clears a SIMD floating-point exception mask bit and sets the corresponding exception flag bit, a SIMD floating-point exception will not be immediately generated. The exception will be generated only upon the execution of the next instruction that meets both conditions below:

- the instruction must operate on an XMM or YMM register operand,
- the instruction causes that particular SIMD floating-point exception to be reported.

This instruction’s operation is the same in non-64-bit modes and 64-bit mode.

If VLDMXCSR is encoded with VEX.L= 1, an attempt to execute the instruction encoded with VEX.L= 1 will cause an #UD exception.

Note: In VEX-encoded versions, VEX.vvvv is reserved and must be 1111b, otherwise instructions will #UD.

Operation

MXCSR := m32;

C/C++ Compiler Intrinsic Equivalent

_mm_setcsr(unsigned int i)

Numeric Exceptions

None.

Other Exceptions

See Table 2-22, “Type 5 Class Exception Conditions,” additionally:

#GP For an attempt to set reserved bits in MXCSR.
#UD If VEX.vvvv ≠ 1111B.

LDS/LES/LFS/LGS/LSS—Load Far Pointer

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|------------------|----------------|-------|-------------|-----------------|---|
| C5 /r | LDS r16,m16:16 | RM | Invalid | Valid | Load DS:r16 with far pointer from memory. |
| C5 /r | LDS r32,m16:32 | RM | Invalid | Valid | Load DS:r32 with far pointer from memory. |
| OF B2 /r | LSS r16,m16:16 | RM | Valid | Valid | Load SS:r16 with far pointer from memory. |
| OF B2 /r | LSS r32,m16:32 | RM | Valid | Valid | Load SS:r32 with far pointer from memory. |
| REX.W + OF B2 /r | LSS r64,m16:64 | RM | Valid | N.E. | Load SS:r64 with far pointer from memory. |
| C4 /r | LES r16,m16:16 | RM | Invalid | Valid | Load ES:r16 with far pointer from memory. |
| C4 /r | LES r32,m16:32 | RM | Invalid | Valid | Load ES:r32 with far pointer from memory. |
| OF B4 /r | LFS r16,m16:16 | RM | Valid | Valid | Load FS:r16 with far pointer from memory. |
| OF B4 /r | LFS r32,m16:32 | RM | Valid | Valid | Load FS:r32 with far pointer from memory. |
| REX.W + OF B4 /r | LFS r64,m16:64 | RM | Valid | N.E. | Load FS:r64 with far pointer from memory. |
| OF B5 /r | LGS r16,m16:16 | RM | Valid | Valid | Load GS:r16 with far pointer from memory. |
| OF B5 /r | LGS r32,m16:32 | RM | Valid | Valid | Load GS:r32 with far pointer from memory. |
| REX.W + OF B5 /r | LGS r64,m16:64 | RM | Valid | N.E. | Load GS:r64 with far pointer from memory. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|-----------|-----------|
| RM | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Loads a far pointer (segment selector and offset) from the second operand (source operand) into a segment register and the first operand (destination operand). The source operand specifies a 48-bit or a 32-bit pointer in memory depending on the current setting of the operand-size attribute (32 bits or 16 bits, respectively). The instruction opcode and the destination operand specify a segment register/general-purpose register pair. The 16-bit segment selector from the source operand is loaded into the segment register specified with the opcode (DS, SS, ES, FS, or GS). The 32-bit or 16-bit offset is loaded into the register specified with the destination operand.

If one of these instructions is executed in protected mode, additional information from the segment descriptor pointed to by the segment selector in the source operand is loaded in the hidden part of the selected segment register.

Also in protected mode, a NULL selector (values 0000 through 0003) can be loaded into DS, ES, FS, or GS registers without causing a protection exception. (Any subsequent reference to a segment whose corresponding segment register is loaded with a NULL selector, causes a general-protection exception (#GP) and no memory reference to the segment occurs.)

In 64-bit mode, the instruction's default operation size is 32 bits. Using a REX prefix in the form of REX.W promotes operation to specify a source operand referencing an 80-bit pointer (16-bit selector, 64-bit offset) in memory. Using a REX prefix in the form of REX.R permits access to additional registers (R8-R15). See the summary chart at the beginning of this section for encoding data and limits.

Operation

64-BIT_MODE

IF SS is loaded

THEN

IF SegmentSelector = NULL and ((RPL = 3) or
(RPL ≠ 3 and RPL ≠ CPL))

THEN #GP(0);

    SegmentRegister := SegmentDescriptor([SRC]);
FI;
ELSE IF DS, ES, FS, or GS is loaded with a NULL selector:
    THEN
        SegmentRegister := NULLSelector;
        SegmentRegister(DescriptorValidBit) := 0; FI; (* Hidden flag;
            not accessible by software *)
    FI;
    DEST := Offset(SRC);
Real-Address or Virtual-8086 Mode
    SegmentRegister := SegmentSelector(SRC); FI;
    DEST := Offset(SRC);

```

Flags Affected

None.

Protected Mode Exceptions

| | |
|-----------------|---|
| #UD | If source operand is not a memory location. If the LOCK prefix is used. |
| #GP(0) | If a NULL selector is loaded into the SS register. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register is used to access memory and it contains a NULL segment selector. |
| #GP(selector) | If the SS register is being loaded and any of the following is true: the segment selector index is not within the descriptor table limits, the segment selector RPL is not equal to CPL, the segment is a non-writable data segment, or DPL is not equal to CPL. If the DS, ES, FS, or GS register is being loaded with a non-NULL segment selector and any of the following is true: the segment selector index is not within descriptor table limits, the segment is neither a data nor a readable code segment, or the segment is a data or nonconforming-code segment and both RPL and CPL are greater than DPL. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #SS(selector) | If the SS register is being loaded and the segment is marked not present. |
| #NP(selector) | If DS, ES, FS, or GS register is being loaded with a non-NULL segment selector and the segment is marked not present. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |

Real-Address Mode Exceptions

| | |
|-----|---|
| #GP | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS | If a memory operand effective address is outside the SS segment limit. |
| #UD | If source operand is not a memory location. If the LOCK prefix is used. |

Virtual-8086 Mode Exceptions

| | |
|-----------------|---|
| #UD | If source operand is not a memory location. If the LOCK prefix is used. |
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If the memory address is in a non-canonical form. If a NULL selector is attempted to be loaded into the SS register in compatibility mode. If a NULL selector is attempted to be loaded into the SS register in CPL3 and 64-bit mode. If a NULL selector is attempted to be loaded into the SS register in non-CPL3 and 64-bit mode where its RPL is not equal to CPL. |
| #GP(Selector) | If the FS, or GS register is being loaded with a non-NULL segment selector and any of the following is true: the segment selector index is not within descriptor table limits, the memory address of the descriptor is non-canonical, the segment is neither a data nor a readable code segment, or the segment is a data or nonconforming-code segment and both RPL and CPL are greater than DPL. If the SS register is being loaded and any of the following is true: the segment selector index is not within the descriptor table limits, the memory address of the descriptor is non-canonical, the segment selector RPL is not equal to CPL, the segment is a nonwritable data segment, or DPL is not equal to CPL. |
| #SS(0) | If a memory operand effective address is non-canonical |
| #SS(Selector) | If the SS register is being loaded and the segment is marked not present. |
| #NP(selector) | If FS, or GS register is being loaded with a non-NULL segment selector and the segment is marked not present. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3. |
| #UD | If source operand is not a memory location. If the LOCK prefix is used. |

LDTILECFG—Load Tile Configuration

| Opcode/ Instruction | Op/ En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|--|-----------|------------------------------|-----------------------|---|
| VEX.128.NP.OF38.W0 49 ! (11):000:bbb LDTILECFG m512 | A | V/N.E. | AMX-TILE | Load tile configuration as specified in m512. |

Instruction Operand Encoding

| Op/En | Tuple | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-------|---------------|-----------|-----------|-----------|
| A | N/A | ModRM:r/m (r) | N/A | N/A | N/A |

Description

The LDTILECFG instruction takes an operand containing a pointer to a 64-byte memory location containing the description of the tiles to be supported. In order to configure the tiles, the AMX-TILE bit in CPUID must be set and the operating system has to have enabled the tiles architecture.

The memory area contains the palette and describes how many tiles are being used and defines each tile in terms of rows and column bytes. Requests must be compatible with the restrictions provided by CPUID; see Table 3-63 below.

Table 3-63. Memory Area Layout

| Byte(s) | Field Name | Description |
|---------|------------------------|--|
| 0 | palette | Palette selects the supported configuration of the tiles that will be used. |
| 1 | start_row | start_row is used for storing the restart values for interrupted operations. |
| 2-15 | reserved, must be zero | |
| 16-17 | tile0.colsb | Tile 0 bytes per row. |
| 18-19 | tile1.colsb | Tile 1 bytes per row. |
| 20-21 | tile2.colsb | Tile 2 bytes per row. |
| ... | (sequence continues) | |
| 30-31 | tile7.colsb | Tile 7 bytes per row. |
| 32-47 | reserved, must be zero | |
| 48 | tile0.rows | Tile 0 rows. |
| 49 | tile1.rows | Tile 1 rows. |
| 50 | tile2.rows | Tile 2 rows. |
| ... | (sequence continues) | |
| 55 | tile7.rows | Tile 7 rows. |
| 56-63 | reserved, must be zero | |

If a tile row and column pair is not used to specify tile parameters, they must have the value zero. All enabled tiles (based on the palette) must be configured. Specifying tile parameters for more tiles than the implementation limit or the palette limit results in a #GP fault.

If the palette_id is zero, that signifies the INIT state for both TILECFG and TILEDATA. Tiles are zeroed in the INIT state. The only legal non-INIT value for palette_id is 1.

Any attempt to execute the LDTILECFG instruction inside an Intel TSX transaction will result in a transaction abort.

Operation

LDTILECFG mem

```
error := False
buf := read_memory(mem, 64)
temp_tilecfg.palette_id := buf.byte[0]
if temp_tilecfg.palette_id > max_palette:
    error := True
if not xcr0_supports_palette(temp_tilecfg.palette_id):
    error := True
if temp_tilecfg.palette_id != 0:
    temp_tilecfg.start_row := buf.byte[1]
    if buf.byte[2..15] is nonzero:
        error := True
    p := 16
    # configure columns
    for n in 0 ... palette_table[temp_tilecfg.palette_id].max_names-1:
        temp_tilecfg.t[n].colsb := buf.word[p/2]
        p := p + 2
        if temp_tilecfg.t[n].colsb > palette_table[temp_tilecfg.palette_id].bytes_per_row:
            error := True
    if nonzero(buf[p...47]):
        error := True

    # configure rows
    p := 48
    for n in 0 ... palette_table[temp_tilecfg.palette_id].max_names-1:
        temp_tilecfg.t[n].rows := buf.byte[p]
        if temp_tilecfg.t[n].rows > palette_table[temp_tilecfg.palette_id].max_rows:
            error := True
        p := p + 1

    if nonzero(buf[p...63]):
        error := True

    # validate each tile's row & col configs are reasonable and enable the valid tiles
    for n in 0 ... palette_table[temp_tilecfg.palette_id].max_names-1:
        if temp_tilecfg.t[n].rows != 0 and temp_tilecfg.t[n].colsb != 0:
            temp_tilecfg.t[n].valid := 1
        elif temp_tilecfg.t[n].rows == 0 and temp_tilecfg.t[n].colsb == 0:
            temp_tilecfg.t[n].valid := 0
        else:
            error := True// one of rows or colsbwas 0 but not both.

if error:
    #GP
elif temp_tilecfg.palette_id == 0:
    TILES_CONFIGURED := 0// init state
    tilecfg := 0// equivalent to 64B of zeros
    zero_all_tile_data()
else:
    tilecfg := temp_tilecfg
    zero_all_tile_data()
    TILES_CONFIGURED := 1
```

Intel C/C++ Compiler Intrinsic Equivalent

LDTILECFG void _tile_loadconfig(const void *);

Flags Affected

None.

Exceptions

AMX-E1; see Section 2.10, “Intel® AMX Instruction Exception Classes,” for details.

LEA—Load Effective Address

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|---------------|-------------|-------|-------------|-----------------|--|
| 8D /r | LEA r16,m | RM | Valid | Valid | Store effective address for m in register r16. |
| 8D /r | LEA r32,m | RM | Valid | Valid | Store effective address for m in register r32. |
| REX.W + 8D /r | LEA r64,m | RM | Valid | N.E. | Store effective address for m in register r64. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|-----------|-----------|
| RM | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Computes the effective address of the second operand (the source operand) and stores it in the first operand (destination operand). The source operand is a memory address (offset part) specified with one of the processors addressing modes; the destination operand is a general-purpose register. The address-size and operand-size attributes affect the action performed by this instruction, as shown in the following table. The operand-size attribute of the instruction is determined by the chosen register; the address-size attribute is determined by the attribute of the code segment.

Table 3-64. Non-64-bit Mode LEA Operation with Address and Operand Size Attributes

| Operand Size | Address Size | Action Performed |
|--------------|--------------|--|
| 16 | 16 | 16-bit effective address is calculated and stored in requested 16-bit register destination. |
| 16 | 32 | 32-bit effective address is calculated. The lower 16 bits of the address are stored in the requested 16-bit register destination. |
| 32 | 16 | 16-bit effective address is calculated. The 16-bit address is zero-extended and stored in the requested 32-bit register destination. |
| 32 | 32 | 32-bit effective address is calculated and stored in the requested 32-bit register destination. |

Different assemblers may use different algorithms based on the size attribute and symbolic reference of the source operand.

In 64-bit mode, the instruction's destination operand is governed by operand size attribute, the default operand size is 32 bits. Address calculation is governed by address size attribute, the default address size is 64-bits. In 64-bit mode, address size of 16 bits is not encodable. See Table 3-65.

Table 3-65. 64-bit Mode LEA Operation with Address and Operand Size Attributes

| Operand Size | Address Size | Action Performed |
|--------------|--------------|---|
| 16 | 32 | 32-bit effective address is calculated (using 67H prefix). The lower 16 bits of the address are stored in the requested 16-bit register destination (using 66H prefix). |
| 16 | 64 | 64-bit effective address is calculated (default address size). The lower 16 bits of the address are stored in the requested 16-bit register destination (using 66H prefix). |
| 32 | 32 | 32-bit effective address is calculated (using 67H prefix) and stored in the requested 32-bit register destination. |
| 32 | 64 | 64-bit effective address is calculated (default address size) and the lower 32 bits of the address are stored in the requested 32-bit register destination. |
| 64 | 32 | 32-bit effective address is calculated (using 67H prefix), zero-extended to 64-bits, and stored in the requested 64-bit register destination (using REX.W). |
| 64 | 64 | 64-bit effective address is calculated (default address size) and all 64-bits of the address are stored in the requested 64-bit register destination (using REX.W). |

Operation

```
IF OperandSize = 16 and AddressSize = 16
  THEN
    DEST := EffectiveAddress(SRC); (* 16-bit address *)
  ELSE IF OperandSize = 16 and AddressSize = 32
    THEN
      temp := EffectiveAddress(SRC); (* 32-bit address *)
      DEST := temp[0:15]; (* 16-bit address *)
    FI;
  ELSE IF OperandSize = 32 and AddressSize = 16
    THEN
      temp := EffectiveAddress(SRC); (* 16-bit address *)
      DEST := ZeroExtend(temp); (* 32-bit address *)
    FI;
  ELSE IF OperandSize = 32 and AddressSize = 32
    THEN
      DEST := EffectiveAddress(SRC); (* 32-bit address *)
    FI;
  ELSE IF OperandSize = 16 and AddressSize = 64
    THEN
      temp := EffectiveAddress(SRC); (* 64-bit address *)
      DEST := temp[0:15]; (* 16-bit address *)
    FI;
  ELSE IF OperandSize = 32 and AddressSize = 64
    THEN
      temp := EffectiveAddress(SRC); (* 64-bit address *)
      DEST := temp[0:31]; (* 16-bit address *)
    FI;
  ELSE IF OperandSize = 64 and AddressSize = 64
    THEN
      DEST := EffectiveAddress(SRC); (* 64-bit address *)
    FI;
FI;
```

LEAVE—High Level Procedure Exit

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------|-------------|-----------------|-------------------------------|
| C9 | LEAVE | Z0 | Valid | Valid | Set SP to BP, then pop BP. |
| C9 | LEAVE | Z0 | N.E. | Valid | Set ESP to EBP, then pop EBP. |
| C9 | LEAVE | Z0 | Valid | N.E. | Set RSP to RBP, then pop RBP. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Releases the stack frame set up by an earlier ENTER instruction. The LEAVE instruction copies the frame pointer (in the EBP register) into the stack pointer register (ESP), which releases the stack space allocated to the stack frame. The old frame pointer (the frame pointer for the calling procedure that was saved by the ENTER instruction) is then popped from the stack into the EBP register, restoring the calling procedure's stack frame.

A RET instruction is commonly executed following a LEAVE instruction to return program control to the calling procedure.

See "Procedure Calls for Block-Structured Languages" in Chapter 7 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, for detailed information on the use of the ENTER and LEAVE instructions.

In 64-bit mode, the instruction's default operation size is 64 bits; 32-bit operation cannot be encoded. See the summary chart at the beginning of this section for encoding data and limits.

Operation

```
IF StackAddressSize = 32
  THEN
    ESP := EBP;
  ELSE IF StackAddressSize = 64
    THEN RSP := RBP; FI;
  ELSE IF StackAddressSize = 16
    THEN SP := BP; FI;
FI;

IF OperandSize = 32
  THEN EBP := Pop();
  ELSE IF OperandSize = 64
    THEN RBP := Pop(); FI;
  ELSE IF OperandSize = 16
    THEN BP := Pop(); FI;
FI;
```

Flags Affected

None.

Protected Mode Exceptions

LFENCE—Load Fence

| Opcode / Instruction | Op/En | 64/32 bit Mode Support | CPUID Feature Flag | Description |
|-----------------------|-------|------------------------|--------------------|-----------------------------|
| NP 0F AE E8 LFENCE | Z0 | V/V | SSE2 | Serializes load operations. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Performs a serializing operation on all load-from-memory instructions that were issued prior the LFENCE instruction. Specifically, LFENCE does not execute until all prior instructions have completed locally, and no later instruction begins execution until LFENCE completes. In particular, an instruction that loads from memory and that precedes an LFENCE receives data from memory prior to completion of the LFENCE. (An LFENCE that follows an instruction that stores to memory might complete **before** the data being stored have become globally visible.) Instructions following an LFENCE may be fetched from memory before the LFENCE, but they will not execute (even speculatively) until the LFENCE completes.

Weakly ordered memory types can be used to achieve higher processor performance through such techniques as out-of-order issue and speculative reads. The degree to which a consumer of data recognizes or knows that the data is weakly ordered varies among applications and may be unknown to the producer of this data. The LFENCE instruction provides a performance-efficient way of ensuring load ordering between routines that produce weakly-ordered results and routines that consume that data.

Processors are free to fetch and cache data speculatively from regions of system memory that use the WB, WC, and WT memory types. This speculative fetching can occur at any time and is not tied to instruction execution. Thus, it is not ordered with respect to executions of the LFENCE instruction; data can be brought into the caches speculatively just before, during, or after the execution of an LFENCE instruction.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

Specification of the instruction's opcode above indicates a ModR/M byte of E8. For this instruction, the processor ignores the r/m field of the ModR/M byte. Thus, LFENCE is encoded by any opcode of the form 0F AE Ex, where x is in the range 8-F.

Operation

Wait_On_Following_Instructions_Until(preceding_instructions_complete);

Intel C/C++ Compiler Intrinsic Equivalent

`void _mm_lfence(void)`

Exceptions (All Modes of Operation)

#UD If CPUID.01H:EDX.SSE2[bit 26] = 0.
 If the LOCK prefix is used.

LGDT/LIDT—Load Global/Interrupt Descriptor Table Register

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|----------|-------------|-------|-------------|-----------------|-------------------|
| OF 01 /2 | LGDT m16&32 | M | N.E. | Valid | Load m into GDTR. |
| OF 01 /3 | LIDT m16&32 | M | N.E. | Valid | Load m into IDTR. |
| OF 01 /2 | LGDT m16&64 | M | Valid | N.E. | Load m into GDTR. |
| OF 01 /3 | LIDT m16&64 | M | Valid | N.E. | Load m into IDTR. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|-----------|-----------|-----------|
| M | ModRM:r/m (r) | N/A | N/A | N/A |

Description

Loads the values in the source operand into the global descriptor table register (GDTR) or the interrupt descriptor table register (IDTR). The source operand specifies a 6-byte memory location that contains the base address (a linear address) and the limit (size of table in bytes) of the global descriptor table (GDT) or the interrupt descriptor table (IDT). If operand-size attribute is 32 bits, a 16-bit limit (lower 2 bytes of the 6-byte data operand) and a 32-bit base address (upper 4 bytes of the data operand) are loaded into the register. If the operand-size attribute is 16 bits, a 16-bit limit (lower 2 bytes) and a 24-bit base address (third, fourth, and fifth byte) are loaded. Here, the high-order byte of the operand is not used and the high-order byte of the base address in the GDTR or IDTR is filled with zeros.

The LGDT and LIDT instructions are used only in operating-system software; they are not used in application programs. They are the only instructions that directly load a linear address (that is, not a segment-relative address) and a limit in protected mode. They are commonly executed in real-address mode to allow processor initialization prior to switching to protected mode.

In 64-bit mode, the instruction's operand size is fixed at 8+2 bytes (an 8-byte base and a 2-byte limit). See the summary chart at the beginning of this section for encoding data and limits.

See “SGDT—Store Global Descriptor Table Register” in Chapter 4, of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2B, for information on storing the contents of the GDTR and IDTR.

Operation

```
IF Instruction is LIDT
  THEN
    IF OperandSize = 16
      THEN
        IDTR(Limit) := SRC[0:15];
        IDTR(Base) := SRC[16:47] AND 00FFFFFFH;
      ELSE IF 32-bit Operand Size
        THEN
          IDTR(Limit) := SRC[0:15];
          IDTR(Base) := SRC[16:47];
        FI;
      ELSE IF 64-bit Operand Size (* In 64-Bit Mode *)
        THEN
          IDTR(Limit) := SRC[0:15];
          IDTR(Base) := SRC[16:79];
        FI;
      FI;
    ELSE (* Instruction is LGDT *)
      IF OperandSize = 16
        THEN
          GDTR(Limit) := SRC[0:15];
          GDTR(Base) := SRC[16:47] AND 00FFFFFFH;
        ELSE IF 32-bit Operand Size
          THEN
            GDTR(Limit) := SRC[0:15];
            GDTR(Base) := SRC[16:47];
          FI;
        ELSE IF 64-bit Operand Size (* In 64-Bit Mode *)
          THEN
            GDTR(Limit) := SRC[0:15];
            GDTR(Base) := SRC[16:79];

LLDT—Load Local Descriptor Table Register

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|----------|-------------|-------|-------------|-----------------|--|
| OF 00 /2 | LLDT r/m16 | M | Valid | Valid | Load segment selector r/m16 into LDTR. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|-----------|-----------|-----------|
| M | ModRM:r/m (r) | N/A | N/A | N/A |

Description

Loads the source operand into the segment selector field of the local descriptor table register (LDTR). The source operand (a general-purpose register or a memory location) contains a segment selector that points to a local descriptor table (LDT). After the segment selector is loaded in the LDTR, the processor uses the segment selector to locate the segment descriptor for the LDT in the global descriptor table (GDT). It then loads the segment limit and base address for the LDT from the segment descriptor into the LDTR. The segment registers DS, ES, SS, FS, GS, and CS are not affected by this instruction, nor is the LDTR field in the task state segment (TSS) for the current task.

If bits 2-15 of the source operand are 0, LDTR is marked invalid and the LLDT instruction completes silently. However, all subsequent references to descriptors in the LDT (except by the LAR, VERR, VERW or LSL instructions) cause a general protection exception (#GP).

The operand-size attribute has no effect on this instruction.

The LLDT instruction is provided for use in operating-system software; it should not be used in application programs. This instruction can only be executed in protected mode or 64-bit mode.

In 64-bit mode, the operand size is fixed at 16 bits.

Operation

LMSW—Load Machine Status Word

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|----------|-------------|-------|-------------|-----------------|--|
| OF 01 /6 | LMSW r/m16 | M | Valid | Valid | Loads r/m16 in machine status word of CR0. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|-----------|-----------|-----------|
| M | ModRM:r/m (r) | N/A | N/A | N/A |

Description

Loads the source operand into the machine status word, bits 0 through 15 of register CR0. The source operand can be a 16-bit general-purpose register or a memory location. Only the low-order 4 bits of the source operand (which contains the PE, MP, EM, and TS flags) are loaded into CR0. The PG, CD, NW, AM, WP, NE, and ET flags of CR0 are not affected. The operand-size attribute has no effect on this instruction.

If the PE flag of the source operand (bit 0) is set to 1, the instruction causes the processor to switch to protected mode. While in protected mode, the LMSW instruction cannot be used to clear the PE flag and force a switch back to real-address mode.

The LMSW instruction is provided for use in operating-system software; it should not be used in application programs. In protected or virtual-8086 mode, it can only be executed at CPL 0.

This instruction is provided for compatibility with the Intel 286 processor; programs and procedures intended to run on IA-32 and Intel 64 processors beginning with Intel386 processors should use the MOV (control registers) instruction to load the whole CR0 register. The MOV CR0 instruction can be used to set and clear the PE flag in CR0, allowing a procedure or program to switch between protected and real-address modes.

This instruction is a serializing instruction.

This instruction's operation is the same in non-64-bit modes and 64-bit mode. Note that the operand size is fixed at 16 bits.

See "Changes to Instruction Behavior in VMX Non-Root Operation" in Chapter 26 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C, for more information about the behavior of this instruction in VMX non-root operation.

Operation

CR0[0:3] := SRC[0:3];

Flags Affected

None.

Protected Mode Exceptions

- #GP(0) If the current privilege level is not 0.
If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.
If the DS, ES, FS, or GS register is used to access memory and it contains a NULL segment selector.
- #SS(0) If a memory operand effective address is outside the SS segment limit.
- #PF(fault-code) If a page fault occurs.
- #UD If the LOCK prefix is used.

Real-Address Mode Exceptions

- #GP If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.
- #UD If the LOCK prefix is used.

Virtual-8086 Mode Exceptions

| | |
|--------|--|
| #GP(0) | The LMSW instruction is not recognized in virtual-8086 mode. |
| #UD | If the LOCK prefix is used. |

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|---|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the current privilege level is not 0. If the memory address is in a non-canonical form. |
| #PF(fault-code) | If a page fault occurs. |
| #UD | If the LOCK prefix is used. |

LOADIWKEY—Load Internal Wrapping Key With Key Locker

| Opcode/ Instruction | Op/ En | 64/32-bit Mode | CPUID Feature Flag | Description |
|---|-----------|-------------------|--------------------------|---|
| F3 0F 38 DC 11:rrr:bbb LOADIWKEY xmm1, xmm2, <EAX>, <XMM0> | A | V/V | KL | Load internal wrapping key from xmm1, xmm2, and XMM0. |

Instruction Operand Encoding

| Op/En | Tuple | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-------|---------------|---------------|------------------|-------------------|
| A | N/A | ModRM:reg (r) | ModRM:r/m (r) | Implicit EAX (r) | Implicit XMM0 (r) |

Description

The `LOADIWKEY`¹ instruction writes the Key Locker internal wrapping key, which is called IWKey. This IWKey is used by the `ENCODEKEY*` instructions to wrap keys into handles. Conversely, the `AESENC/DEC*KL` instructions use IWKey to unwrap those keys from the handles and help verify the handle integrity. For security reasons, no instruction is designed to allow software to directly read the IWKey value.

IWKey includes two cryptographic keys as well as metadata. The two cryptographic keys are loaded from register sources so that `LOADIWKEY` can be executed without the keys ever being in memory.

The key input operands are:

- The 256-bit encryption key is loaded from the two explicit operands.
- The 128-bit integrity key is loaded from the implicit operand XMM0.

The implicit operand EAX specifies the KeySource and whether backing up the key is permitted:

- EAX[0] – When set, the wrapping key being initialized is not permitted to be backed up to platform-scoped storage.
- EAX[4:1] – This specifies the KeySource, which is the type of key. Currently only two encodings are supported. A KeySource of 0 indicates that the key input operands described above should be directly stored as the internal wrapping keys. `LOADIWKEY` with a KeySource of 1 will have random numbers from the on-chip random number generator XORed with the source registers (including XMM0) so that the software that executes the `LOADIWKEY` does not know the actual IWKey encryption and integrity keys. Software can choose to put additional random data into the source registers so that other sources of random data are combined with the hardware random number generator supplied value. Software should always check ZF after executing `LOADIWKEY` with KeySource of 1 as this operation may fail due to it being unable to get sufficient full-entropy data from the on-chip random number generator. Both KeySource of 0 and 1 specify that IWKey be used with the AES-GCM-SIV algorithm. CPUID.19H.ECX[1] enumerates support for KeySource of 1. All other KeySource encodings are reserved.
- EAX[31:5] – Reserved.

1. Further details on Key Locker and usage of this instruction can be found here:

<https://software.intel.com/content/www/us/en/develop/download/intel-key-locker-specification.html>.

Operation

LOADIWKEY

```
IF CPL > 0                // LOADKWKEY only allowed at ring 0 (supervisor mode)
    THEN #GP (0); FI;
IF EAX[4:1] > 1            // Reserved KeySource encoding used
    THEN #GP (0); FI;
IF EAX[31:5] != 0          // Reserved bit in EAX is set
    THEN #GP (0); FI;
IF EAX[0] AND (CPUID.19H.ECX[0] == 0)    // NoBackup is not supported on this part
    THEN #GP (0); FI;
IF (EAX[4:1] == 1) AND (CPUID.19H.ECX[1] == 0) // KeySource of 1 is not supported on this part
    THEN #GP (0); FI;
IF (EAX[4:1] == 0)        // KeySource of 0
    THEN
        IwKey.Encryption Key[127:0] := SRC2[127:0];
        IwKey.Encryption Key[255:128] := SRC1[127:0];
        IwKey.IntegrityKey[127:0] := XMM0[127:0];
        IwKey.NoBackup = EAX [0];
        IwKey.KeySource = EAX [4:1];
        RFLAGS.ZF := 0;
    ELSE                // KeySource of 1. See RDSEED definition for details of randomness
        IF HW_NRND_GEN.ready == 1                // Full-entropy random data from RDSEED hardware block was received
            THEN
                IwKey.Encryption Key[127:0] := SRC2[127:0] XOR HW_NRND_GEN.data[127:0];
                IwKey.Encryption Key[255:128] := SRC1[127:0] XOR HW_NRND_GEN.data[255:128];
                IwKey.IntegrityKey[127:0] := XMM0[127:0] XOR HW_NRND_GEN.data[383:256];
                IwKey.NoBackup = EAX [0];
                IwKey.KeySource = EAX [4:1];
                RFLAGS.ZF := 0;
            ELSE                // Random data was not returned from RDSEED hardware block. IwKey was not loaded
                RFLAGS.ZF := 1;
        FI;
    FI;
RFLAGS.OF, SF, AF, PF, CF := 0;
```

Flags Affected

ZF is set to 0 if the operation succeeded and set to 1 if the operation failed due to full-entropy random data not being received from RDSEED. The other arithmetic flags (OF, SF, AF, PF, CF) are cleared to 0.

Intel C/C++ Compiler Intrinsic Equivalent

```
LOADIWKEY    void _mm_loadikey(unsigned int ctl, __m128i intkey, __m128i enkey_lo, __m128i enkey_hi);
```

LOCK—Assert LOCK# Signal Prefix

| Opcode ¹ | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|---------------------|-------------|-------|-------------|-----------------|--|
| F0 | LOCK | Z0 | Valid | Valid | Asserts LOCK# signal for duration of the accompanying instruction. |

NOTES:

1. See IA-32 Architecture Compatibility section below.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Causes the processor's LOCK# signal to be asserted during execution of the accompanying instruction (turns the instruction into an atomic instruction). In a multiprocessor environment, the LOCK# signal ensures that the processor has exclusive use of any shared memory while the signal is asserted.

In most IA-32 and all Intel 64 processors, locking may occur without the LOCK# signal being asserted. See the "IA-32 Architecture Compatibility" section below for more details.

The LOCK prefix can be prepended only to the following instructions and only to those forms of the instructions where the destination operand is a memory operand: ADD, ADC, AND, BTC, BTR, BTS, CMPXCHG, CMPXCH8B, CMPXCHG16B, DEC, INC, NEG, NOT, OR, SBB, SUB, XOR, XADD, and XCHG. If the LOCK prefix is used with one of these instructions and the source operand is a memory operand, an undefined opcode exception (#UD) may be generated. An undefined opcode exception will also be generated if the LOCK prefix is used with any instruction not in the above list. The XCHG instruction always asserts the LOCK# signal regardless of the presence or absence of the LOCK prefix.

The LOCK prefix is typically used with the BTS instruction to perform a read-modify-write operation on a memory location in shared memory environment.

The integrity of the LOCK prefix is not affected by the alignment of the memory field. Memory locking is observed for arbitrarily misaligned fields.

This instruction's operation is the same in non-64-bit modes and 64-bit mode.

IA-32 Architecture Compatibility

Beginning with the P6 family processors, when the LOCK prefix is prefixed to an instruction and the memory area being accessed is cached internally in the processor, the LOCK# signal is generally not asserted. Instead, only the processor's cache is locked. Here, the processor's cache coherency mechanism ensures that the operation is carried out atomically with regards to memory. See "Effects of a Locked Operation on Internal Processor Caches" in Chapter 10 of Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A, for more information on locking of caches.

Operation

AssertLOCK#(DurationOfAccompanyingInstruction);

Flags Affected

None.

Protected Mode Exceptions

#UD If the LOCK prefix is used with an instruction not listed: ADD, ADC, AND, BTC, BTR, BTS, CMPXCHG, CMPXCH8B, CMPXCHG16B, DEC, INC, NEG, NOT, OR, SBB, SUB, XOR, XADD, XCHG.

Other exceptions can be generated by the instruction when the LOCK prefix is applied.

| REX.W + AD | LODSQ | Z0 | Valid | N.E. | Load qword at address (R)SI into RAX. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| Z0 | N/A | N/A | N/A | N/A |

Description

Loads a byte, word, or doubleword from the source operand into the AL, AX, or EAX register, respectively. The source operand is a memory location, the address of which is read from the DS:ESI or the DS:SI registers (depending on the address-size attribute of the instruction, 32 or 16, respectively). The DS segment may be overridden with a segment override prefix.

At the assembly-code level, two forms of this instruction are allowed: the “explicit-operands” form and the “no-operands” form. The explicit-operands form (specified with the LODS mnemonic) allows the source operand to be specified explicitly. Here, the source operand should be a symbol that indicates the size and location of the source value. The destination operand is then automatically selected to match the size of the source operand (the AL register for byte operands, AX for word operands, and EAX for doubleword operands). This explicit-operands form is provided to allow documentation; however, note that the documentation provided by this form can be misleading. That is, the source operand symbol must specify the correct **type** (size) of the operand (byte, word, or doubleword), but it does not have to specify the correct **location**. The location is always specified by the DS:(E)SI registers, which must be loaded correctly before the load string instruction is executed.

The no-operands form provides “short forms” of the byte, word, and doubleword versions of the LODS instructions. Here also DS:(E)SI is assumed to be the source operand and the AL, AX, or EAX register is assumed to be the destination operand. The size of the source and destination operands is selected with the mnemonic: LODSB (byte loaded into register AL), LODSW (word loaded into AX), or LODSD (doubleword loaded into EAX).

After the byte, word, or doubleword is transferred from the memory location into the AL, AX, or EAX register, the (E)SI register is incremented or decremented automatically according to the setting of the DF flag in the EFLAGS register. (If the DF flag is 0, the (E)SI register is incremented; if the DF flag is 1, the ESI register is decremented.) The (E)SI register is incremented or decremented by 1 for byte operations, by 2 for word operations, or by 4 for doubleword operations.

In 64-bit mode, use of the REX.W prefix promotes operation to 64 bits. LODS/LODSQ load the quadword at address (R)SI into RAX. The (R)SI register is then incremented or decremented automatically according to the setting of the DF flag in the EFLAGS register.

The LODS, LODSB, LODSW, and LODSD instructions can be preceded by the REP prefix for block loads of ECX bytes, words, or doublewords. More often, however, these instructions are used within a LOOP construct because further processing of the data moved into the register is usually necessary before the next transfer can be made. See “REP/REPE/REPZ /REPNE/REPZ—Repeat String Operation Prefix” in Chapter 4 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2B, for a description of the REP prefix.

Operation

```
IF AL := SRC; (* Byte load *)
    THEN AL := SRC; (* Byte load *)
        IF DF = 0
            THEN (E)SI := (E)SI + 1;
            ELSE (E)SI := (E)SI - 1;
        FI;
ELSE IF AX := SRC; (* Word load *)
    THEN IF DF = 0
        THEN (E)SI := (E)SI + 2;
        ELSE (E)SI := (E)SI - 2;
    IF;
    FI;
ELSE IF EAX := SRC; (* Doubleword load *)
    THEN IF DF = 0
        THEN (E)SI := (E)SI + 4;
        ELSE (E)SI := (E)SI - 4;
    FI;
    FI;
ELSE IF RAX := SRC; (* Quadword load *)
    THEN IF DF = 0
        THEN (R)SI := (R)SI + 8;
        ELSE (R)SI := (R)SI - 8;
    FI;
    FI;
FI;
```

LOOP/LOOPcc—Loop According to ECX Counter

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|--------|-------------|-------|-------------|-----------------|---|
| E2 cb | LOOP rel8 | D | Valid | Valid | Decrement count; jump short if count \neq 0. |
| E1 cb | LOOPE rel8 | D | Valid | Valid | Decrement count; jump short if count \neq 0 and ZF = 1. |
| E0 cb | LOOPNE rel8 | D | Valid | Valid | Decrement count; jump short if count \neq 0 and ZF = 0. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|-----------|-----------|-----------|-----------|
| D | Offset | N/A | N/A | N/A |

Description

Performs a loop operation using the RCX, ECX or CX register as a counter (depending on whether address size is 64 bits, 32 bits, or 16 bits). Note that the LOOP instruction ignores REX.W; but 64-bit address size can be over-ridden using a 67H prefix.

Each time the LOOP instruction is executed, the count register is decremented, then checked for 0. If the count is 0, the loop is terminated and program execution continues with the instruction following the LOOP instruction. If the count is not zero, a near jump is performed to the destination (target) operand, which is presumably the instruction at the beginning of the loop.

The target instruction is specified with a relative offset (a signed offset relative to the current value of the instruction pointer in the IP/EIP/RIP register). This offset is generally specified as a label in assembly code, but at the machine code level, it is encoded as a signed, 8-bit immediate value, which is added to the instruction pointer. Offsets of -128 to $+127$ are allowed with this instruction.

Some forms of the loop instruction (LOOPcc) also accept the ZF flag as a condition for terminating the loop before the count reaches zero. With these forms of the instruction, a condition code (cc) is associated with each instruction to indicate the condition being tested for. Here, the LOOPcc instruction itself does not affect the state of the ZF flag; the ZF flag is changed by other instructions in the loop.

Operation

```

IF (AddressSize = 32)
    THEN Count is ECX;
ELSE IF (AddressSize = 64)
    Count is RCX;
ELSE Count is CX;

LSL—Load Segment Limit

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|------------------|-------------------------------|-------|-------------|-----------------|---|
| OF 03 /r | LSL r16, r16/m16 | RM | Valid | Valid | Load segment limit from specified descriptor. |
| OF 03 /r | LSL r32, r32/m16 ¹ | RM | Valid | Valid | Load segment limit from specified descriptor. |
| REX.W + OF 03 /r | LSL r64, r32/m16 ¹ | RM | Valid | Valid | Load segment limit from specified descriptor. |

NOTES:

1. Regardless of operand size, only bits 15:0 of a register operand are used. Other bits are ignored.

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|-----------|-----------|
| RM | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

Loads the segment limit from the segment descriptor (see below) specified with the second operand (source operand) into the first operand (destination operand) and sets the ZF flag in the EFLAGS register. The source operand (which can be a register or a memory location) contains the segment selector for the segment descriptor being accessed. If the source operand is a memory address, only 16 bits of data are accessed. The destination operand is a general-purpose register.

The processor performs access checks as part of the loading process. Once loaded in the destination register, software can compare the segment limit with the offset of a pointer.

The segment limit is a 20-bit value contained in bytes 0 and 1 and in the first 4 bits of byte 6 of the segment descriptor. If the descriptor has a byte granular segment limit (the granularity flag is set to 0), the destination operand is loaded with a byte granular value (byte limit) as read from the descriptor. If the descriptor has a page granular segment limit (the granularity flag is set to 1), the LSL instruction will translate the page granular limit (page limit) into a byte limit before loading it into the destination operand. The translation is performed by shifting the 20-bit “raw” limit left 12 bits and filling the low-order 12 bits with 1s.

When the operand size is 16 bits, a valid 32-bit byte limit is computed; however, the upper 16 bits are truncated and only the low-order 16 bits are loaded into the destination operand; the upper bits of the destination are unmodified. When the operand size is 32 bits, the 32-bit byte limit is loaded into the destination operand; the upper bits of the destination are cleared. When the operand is 64 bits, the 32-bit byte limit is zero-extended to 64 bits and loaded into the destination operand. (The behavior with 32-bit and 64-bit operand sizes is identical.)

This instruction performs the following checks before it loads the segment limit into the destination register:

- Checks that the segment selector is not NULL.
- Checks that the segment selector points to a descriptor that is within the limits of the GDT or LDT being accessed
- Checks that the descriptor type is valid for this instruction. All code and data segment descriptors are valid for (can be accessed with) the LSL instruction. The valid special segment and gate descriptor types are given in the Table 3-66.
- If the segment is not a conforming code segment, the instruction checks that the specified segment descriptor is visible at the CPL (that is, if the CPL and the RPL of the segment selector are less than or equal to the DPL of the segment selector).

If the segment descriptor cannot be accessed or is an invalid type for the instruction, the ZF flag is cleared and no value is loaded in the destination operand.

Table 3-66. Segment and Gate Descriptor Types

| Type | Protected Mode | | IA-32e Mode | |
|------|-------------------------|-------|------------------------------|-------|
| | Name | Valid | Name | Valid |
| 0 | Reserved | No | Reserved | No |
| 1 | Available 16-bit TSS | Yes | Reserved | No |
| 2 | LDT | Yes | LDT ¹ | Yes |
| 3 | Busy 16-bit TSS | Yes | Reserved | No |
| 4 | 16-bit call gate | No | Reserved | No |
| 5 | 16-bit/32-bit task gate | No | Reserved | No |
| 6 | 16-bit interrupt gate | No | Reserved | No |
| 7 | 16-bit trap gate | No | Reserved | No |
| 8 | Reserved | No | Reserved | No |
| 9 | Available 32-bit TSS | Yes | 64-bit TSS ¹ | Yes |
| A | Reserved | No | Reserved | No |
| B | Busy 32-bit TSS | Yes | Busy 64-bit TSS ¹ | Yes |
| C | 32-bit call gate | No | 64-bit call gate | No |
| D | Reserved | No | Reserved | No |
| E | 32-bit interrupt gate | No | 64-bit interrupt gate | No |
| F | 32-bit trap gate | No | 64-bit trap gate | No |

NOTES:

1. In this case, the descriptor comprises 16 bytes; bits 12:8 of the upper 4 bytes must be 0.

Operation

IF SRC(Offset) > descriptor table limit
THEN ZF := 0; FI;

Read segment descriptor;

IF SegmentDescriptor(Type) ≠ conforming code segment
and (CPL > DPL) OR (RPL > DPL)
or Segment type is not valid for instruction

THEN

ZF := 0;

ELSE

temp := SegmentLimit([SRC]);

IF (SegmentDescriptor(G) = 1)

THEN temp := (temp << 12) OR 00000FFFH;

ELSE IF OperandSize = 32

THEN DEST := temp; FI;

ELSE IF OperandSize = 64 (* REX.W used *)

THEN DEST := temp(* Zero-extended *); FI;

ELSE (* OperandSize = 16 *)

DEST := temp AND FFFFH;

FI;

FI;

Flags Affected

The ZF flag is set to 1 if the segment limit is loaded successfully; otherwise, it is set to 0. The CF, OF, SF, AF, and PF flags are not modified.

Protected Mode Exceptions

| | |
|-----------------|--|
| #GP(0) | If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register is used to access memory and it contains a NULL segment selector. |

Virtual-8086 Mode Exceptions

| | |
|-----|--|
| #UD | The LSL instruction cannot be executed in virtual-8086 mode. |
|-----|--|

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

| | |
|-----------------|--|
| #SS(0) | If the memory operand effective address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the memory operand effective address is in a non-canonical form. |
| #PF(fault-code) | If a page fault occurs. |
| #AC(0) | If alignment checking is enabled and the memory operand effective address is unaligned while the current privilege level is 3. |
| #UD | If the LOCK prefix is used. |

LTR—Load Task Register

| Opcode | Instruction | Op/En | 64-Bit Mode | Compat/Leg Mode | Description |
|----------|-------------|-------|-------------|-----------------|--------------------------------|
| OF 00 /3 | LTR r/m16 | M | Valid | Valid | Load r/m16 into task register. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|-----------|-----------|-----------|
| M | ModRM:r/m (r) | N/A | N/A | N/A |

Description

Loads the source operand into the segment selector field of the task register. The source operand (a general-purpose register or a memory location) contains a segment selector that points to a task state segment (TSS). After the segment selector is loaded in the task register, the processor uses the segment selector to locate the segment descriptor for the TSS in the global descriptor table (GDT). It then loads the segment limit and base address for the TSS from the segment descriptor into the task register. The task pointed to by the task register is marked busy, but a switch to the task does not occur.

The LTR instruction is provided for use in operating-system software; it should not be used in application programs. It can only be executed in protected mode when the CPL is 0. It is commonly used in initialization code to establish the first task to be executed.

The operand-size attribute has no effect on this instruction.

In 64-bit mode, the operand size is still fixed at 16 bits. The instruction references a 16-byte descriptor to load the 64-bit base.

Operation

IF SRC is a NULL selector

THEN #GP(0);

IF SRC(Offset) > descriptor table limit OR IF SRC(type) ≠ global

THEN #GP(segment selector); FI;

Read segment descriptor;

IF segment descriptor is not for an available TSS

THEN #GP(segment selector); FI;

IF segment descriptor is not present

THEN #NP(segment selector); FI;

TSSsegmentDescriptor(busy) := 1;

(* Locked read-modify-write operation on the entire descriptor when setting busy flag *)

TaskRegister(SegmentSelector) := SRC;

TaskRegister(SegmentDescriptor) := TSSSegmentDescriptor;

Flags Affected

None.

Protected Mode Exceptions

| | |
|-----------------|---|
| #GP(0) | If the current privilege level is not 0. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the source operand contains a NULL segment selector. If the DS, ES, FS, or GS register is used to access memory and it contains a NULL segment selector. |
| #GP(selector) | If the source selector points to a segment that is not a TSS or to one for a task that is already busy. If the selector points to LDT or is beyond the GDT limit. |
| #NP(selector) | If the TSS descriptor is marked not present. |
| #SS(0) | If a memory operand effective address is outside the SS segment limit. |
| #PF(fault-code) | If a page fault occurs. |
| #UD | If the LOCK prefix is used. |

|-----|---|

Virtual-8086 Mode Exceptions

| | |
|-----|---|
| #UD | The LTR instruction is not recognized in virtual-8086 mode. |
|-----|---|

Compatibility Mode Exceptions

Same exceptions as in protected mode, as well as the following:

| | |
|---------------|--|
| #GP(selector) | If the source selector points to a 16-bit TSS. |
|---------------|--|

64-Bit Mode Exceptions

| | |
|-----------------|---|
| #SS(0) | If a memory address referencing the SS segment is in a non-canonical form. |
| #GP(0) | If the current privilege level is not 0. If the memory address is in a non-canonical form. If the source operand contains a NULL segment selector. |
| #GP(selector) | If the source selector points to a segment that is not a TSS, to a 16-bit TSS, or to a TSS for a task that is already busy. If the selector points to LDT or is beyond the GDT limit. If the descriptor type of the upper 8-byte of the 16-byte descriptor is non-zero. |
| #NP(selector) | If the TSS descriptor is marked not present. |
| #PF(fault-code) | If a page fault occurs. |
| #UD | If the LOCK prefix is used. |

LZCNT—Count the Number of Leading Zero Bits

| Opcode/Instruction | Op/En | 64/32-bit Mode | CPUID Feature Flag | Description |
|---------------------------------------|-------|----------------|--------------------|---|
| F3 0F BD /r LZCNT r16, r/m16 | RM | V/V | LZCNT | Count the number of leading zero bits in r/m16, return result in r16. |
| F3 0F BD /r LZCNT r32, r/m32 | RM | V/V | LZCNT | Count the number of leading zero bits in r/m32, return result in r32. |
| F3 REX.W 0F BD /r LZCNT r64, r/m64 | RM | V/N.E. | LZCNT | Count the number of leading zero bits in r/m64, return result in r64. |

Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Operand 4 |
|-------|---------------|---------------|-----------|-----------|
| RM | ModRM:reg (w) | ModRM:r/m (r) | N/A | N/A |

Description

LZCNT counts the number of leading most significant zero bits in a source operand (second operand) and returns the result in the destination (first operand). LZCNT is an extension of the BSR instruction. The key difference between the LZCNT and BSR instructions is that when the source operand is zero, LZCNT outputs the operand size to the destination operand, whereas BSR leaves the destination operand unmodified.

On processors that do not support LZCNT, the instruction byte encoding is executed as BSR.

Operation

```
temp := OperandSize - 1
DEST := 0
WHILE (temp >= 0) AND (Bit(SRC, temp) = 0)
DO
    temp := temp - 1
    DEST := DEST + 1
OD

IF DEST = OperandSize
    CF := 1
ELSE
    CF := 0
FI

IF DEST = 0
    ZF := 1
ELSE
    ZF := 0
FI
```

Flags Affected

ZF flag is set to 1 in case of zero output (most significant bit of the source is set), and to 0 otherwise, CF flag is set to 1 if input was zero and cleared otherwise. OF, SF, PF, and AF flags are undefined.

Intel C/C++ Compiler Intrinsic Equivalent

```
LZCNT unsigned __int32 _lzcnt_u32(unsigned __int32 src);
LZCNT unsigned __int64 _lzcnt_u64(unsigned __int64 src);
```

Protected Mode Exceptions

| | |
